# **Retain This Manual In A Safe Place For Future Reference**

American Dryer Corporation products embody advanced concepts in engineering, design, and safety. If this product is properly maintained, it will provide many years of safe, efficient, and trouble-free operation.

***ONLY properly licensed technicians should service this equipment.***

**OBSERVE ALL SAFETY PRECAUTIONS** displayed on the equipment or specified in the installation/operator's manual included with the dryer.

**WARNING: UNDER NO CIRCUMSTANCES should the door switch or the heat circuit devices ever be disabled.**

**WARNING: The dryer must never be operated with any of the back guards, outer tops, or service panels removed. PERSONAL INJURY or FIRE COULD RESULT.**

We have tried to make this manual as complete as possible and hope you will find it useful. ADC reserves the right to make changes from time to time, without notice or obligation, in prices, specifications, colors, and material, and to change or discontinue models.

## **Important**

For your convenience, log the following information:

DATE OF PURCHASE \_\_\_\_\_ MODEL NO. \_\_\_\_\_

DISTRIBUTOR'S NAME \_\_\_\_\_

Serial Number(s) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Replacement parts can be obtained from your distributor or the ADC factory. When ordering replacement parts from the factory, you can FAX your order to ADC at (508) 678-9447 or telephone your orders directly to the ADC Parts Department at (508) 678-9010. Please specify the dryer **model number and serial number** in addition to the **description and part number**, so that your order is processed accurately and promptly.

The illustrations on the following pages may not depict your particular dryer exactly. The illustrations are a composite of the various dryer models. Be sure to check the descriptions of the parts thoroughly before ordering.

**INSTRUCTIONS TO BE FOLLOWED IN THE EVENT THE USER SMELLS GAS MUST BE POSTED IN A PROMINENT LOCATION. THE INSTRUCTIONS TO BE POSTED SHALL BE OBTAINED FROM THE LOCAL GAS SUPPLIER.**

## **IMPORTANT**

**YOU MUST DISCONNECT and LOCKOUT THE ELECTRIC SUPPLY and THE GAS SUPPLY or THE STEAM SUPPLY BEFORE ANY COVERS or GUARDS ARE REMOVED FROM THE MACHINE TO ALLOW ACCESS FOR CLEANING, ADJUSTING, INSTALLATION, or TESTING OF ANY EQUIPMENT per OSHA (Occupational Safety and Health Administration) STANDARDS.**

## **FOR YOUR SAFETY**

**DO NOT STORE OR USE GASOLINE OR OTHER FLAMMABLE VAPOR AND LIQUIDS IN THE VICINITY OF THIS OR ANY OTHER APPLIANCE.**

**DO NOT DRY MOP HEADS IN THE DRYER.**

**DO NOT USE DRYER IN THE PRESENCE OF DRY CLEANING FUMES.**

## **WARNING**

**CHILDREN SHOULD NOT BE ALLOWED TO PLAY ON OR IN THE DRYER(S).**

**CHILDREN SHOULD BE SUPERVISED IF NEAR DRYER(S) IN OPERATION.**

## **CAUTION**

**DRYER(S) SHOULD NEVER BE LEFT UNATTENDED WHILE IN OPERATION.**

## **IMPORTANT**

**PLEASE OBSERVE ALL SAFETY PRECAUTIONS displayed on the equipment and/or specified in the installation/operator's manual included with the dryer.**

**Dryer(s) **must not** be installed or stored in an area where it will be exposed to water and/or weather.**

**The wiring diagram for the dryer is located in the front electrical control box area.**

## SECTION I

### INSTALLATION

Except where conditions do not allow, dryer should be handled in an upright position at all times. This unit should be installed by competent workmen in accordance with local and state codes.

UNCRATING DRYER. Remove carton or slatted crate, packing, and polyethylene cover from dryer. Dryer is fastened to the skid by four bolts. Remove skid by unscrewing these bolts. Two can be reached from the rear of the dryer, and two are located in the lint chamber. Slide the dryer off the skid. Remove the protective tape from the doors and sail switch if applicable. Read and follow instructions attached to the main door glass.

LOCATION OF DRYER. Position dryer with back about two feet from wall to allow room for ductwork, piping and maintenance. Level dryer using the four legs located in the base.

DRYER ENCLOSURE. Bulkheads and partitions should be made of non-combustible materials but must be located twelve inches above dryer top panel. (See Fig. 1, page 5-4.) Air considerations are important for adequate operation.

EXHAUST DUCT AND AIR INTAKE. See figures 1 and 2 on page 5-2 and 5-3 in the technical data section. Also see page 5-5 for duct locations.

ELECTRICAL CONNECTIONS. The only electrical connection necessary on the gas or the steam dryer is to the junction box or to the side of the wiring channel. See page 5-5. Use the wiring diagram on the inner side of the control door for connection data. Connect the power wiring as per the local code, (minimum #12 wire). Check the data plate for the correct voltage for your particular dryer. On the electric dryer, the only connections are to the relay in the relay box in the rear of the dryer. See the schematic on the relay cover for the proper connections. CAUTION: Use only copper cable for installation connections. The use of aluminum cable will void your warranty.

Low voltage is a cause of motor overheating and failure. Be sure that your power supply is adequate. Overload protection and individual switches may be installed for each dryer. The motors are internally protected against overloading.

GAS CONNECTIONS: All dryers are provided with a 1/2" gas inlet. See page 5-5 for gas inlet locations. Check with your gas supplier for correct line size and pressure for your installation. A built-in pressure regulator reduces all line pressure to 3 1/2" W.C. at the burner manifold except for L.P. gas where pressure regulation is provided by the gas supplier.

A shut off cock and union should be provided at the rear of each dryer for service convenience. A pipe joint sealant compound resistant to liquefied petroleum gases should be used on all gas connections. The gas connections should be tested for leaks by the use of a soap and water solution. Dryers, as ordered from the factory, are equipped with the proper gas orifices and adjusted air mixture for the type of gas to be used. (See page 5-6, Table 1, 2, and 3.) If further mixture adjustment is necessary, rotate the air orifice plates until yellow color is at a minimum in the flame.

## INSTALLATION INSTRUCTIONS FOR STEAM DRYERS

### LOW PRESSURE

It is very important to realize that in the installation of low pressure steam dryers (nine to fifteen P.S.I.G.), that there is very little pressure to push the steam through the system. Therefore, in installation of from three to seven dryers we strongly recommend the following:

- a) a 3" pipe for main steam line
- b) a 2" pipe for return steam line
- c) a 1" pipe from main steam line to dryer
- d) a 1" pipe from dryer to return

Perhaps most important of all, the return line from coil of each dryer should be positioned for a gravity feed to condensate tank. A separate impulse trap and filter should be installed at each dryer. For efficiency, all steam and condensate lines should be well insulated. For proper flow of steam and condensate, piping should be planned and installed in accordance with good commercial steam system practices.

After the first day or two of operation, the filters should be cleaned out to remove any piping compound or other foreign material.

In event of slower drying, the following points should be checked:

- a) Pressure (10-15 P.S.I.G.)
- b) Filters and traps clean and working.
- c) Plumbing checked for proper flow of steam and condensate.
- d) Sufficient make up air at heat exchanger.
- e) Dryers properly exhausted.

A high pressure steam dryer is also available and is similar to the low pressure unit. Each coil has one 1" inlet and one 1/2" outlet and is rated for 125 P.S.I.G. maximum pressure.

For steam connections and exhaust location see page 5-5.

## SECTION II

### OPERATING INSTRUCTIONS

- LIGHTING PILOT:
- a) Turn on gas supply to the dryer.
  - b) Push and hold down red reset button on gas valve.
  - c) Light pilot and continue to hold down reset button thirty to forty-five seconds. Release reset button. The pilot should remain lit. If not, repeat steps b & c.
  - d) The main burner should now ignite from the pilot when the dryer is operated.
  - e) If for some reason the pilot goes out, a five minute complete shut-off period should be observed before relighting the pilot.
  - f) If the pilot does not light or stay lit after the repeated procedure, consult Section III of this manual.

All dryers are thoroughly tested and inspected before leaving our plant. However, a pre-operational test should be taken before the dryer is to be publicly used. It is possible that adjustments have changed in transit.

IMPORTANT: The tumbler of the dryer is treated with a protective coating. Tumble old clothes using a mild detergent to remove this coating.

### MAINTENANCE

CLEANING: Be sure the snap action thermostats and door switches are kept free from lint accumulation. Clean lint from the bottom and walls of the linge chamber and from lint trap and lint screens at least once a week. These cleaning requirements are essential to efficient and safe operation. Lint from most fabrics is highly combustible.

LUBRICATION: Apply a drop of oil occasionally to the back draft damper pivots. See the instructions printed on the motor back plate for lubrication.

BELT ADJUSTMENT: Make belt adjustments periodically. See page 4-14. Do not remove belts.

- 1) Loosen bolts (7) and (8) and jam nut (1).
- 2) Advance screw (5) until belts are in proper tension.
- 3) Retighten bolts and jam nut.
- 4) Apply a belt conditioner periodically according to the container instructions.

### SECTION III

#### SERVICING

GENERAL: All electrical service should be made with POWER-OFF. Any service tests requiring POWER-ON should be made only by fully guaranteed electricians.

ELECTRICAL COMPONENTS EXCLUDING THE MOTOR: Electrical switches and thermostats can be checked with an ohmeter connected in parallel to the component or to its leads on the terminal board if accessibility is not feasible. The snap action thermostats have normally closed contacts and open only when the preset temperature is reached. To test a snap action thermostat in the above manner, it must be determined whether the thermostat should be in a closed or an open position. Thermostats can fail in either the closed or open position.

INDICATOR LIGHT: This light indicates that the dryer is either on or off and is located in the upper right hand corner of the front panel.

- TO REPLACE:
- a) Turn power off.
  - b) Disconnect the indicator light leads from the terminal board.
  - c) Remove the light from the front panel.
  - d) Replace by reversing procedure.

ROCKER SWITCH: This switch is used for selection of temperature and is located on the front panel.

- TO REPLACE:
- a) Turn power off.
  - b) Remove switch from the front panel.
  - c) Disconnect leads from the switch.
  - d) Replace switch after connecting the leads as per the schematic on the control door.

ELECTRIC TIMER: This unit regulates time required to operate dryer and is located on the upper right hand corner of the front panel.

- TO REPLACE:
- a) Turn power off.
  - b) If only the clock is defective, hold the clock with your left hand and rotate counter-clockwise and remove. Replace new clock by rotating clockwise. (Not all timers have this feature and must be removed to gain access to screws.)
  - c) Disconnect the timer leads from the terminal board.
  - d) Loosen the screw in timer knob and remove.
  - e) Remove the hex nut which holds the timer to the front panel.
  - f) Remove timer from dryer through the wiring box, and replace with new unit if needed.
  - g) To attach timer to the dryer, reverse the removal procedure and connect wiring per the schematic located on inside of the control door.

COIN METER: The coin meter controls both the timing motor and dryer operation. Both units operate until the purchased time has expired. The coin meter is located on the upper right hand corner of the front panel, and is in the coinmeter vault on the 15# and 30# dryers. (See illustration pages 4-10, 4-24.)

- TO REPLACE:
- a) Turn power off.
  - b) Disconnect the leads of the coin meter (2) from the terminal board (5).
  - c) Unscrew the nylon extension nut (1). Rotate bottom of meter away from panel as shown by arrow.
  - d) Replace the unit if needed. If only a switch adjustment is needed refer to Greenwald literature.
  - e) Replace by reversing the removal procedure and connect wiring per the schematic located on inside of the control door.

MAIN DOOR SWITCH: This switch is located in the rear lower right hand corner of the front panel and breaks the motor and heating unit circuit when the main door is opened. The meter indicator light and pilot remain on. (See illustration page 4-10.)

- TO REPLACE
- OR ADJUST:
- a) Turn power off.
  - b) Open lint door for accessibility to the main door switch.
  - c) If an adjustment is needed, loosen the two screws holding the main door switch (10). If the switch is defective, disconnect the wire leads from switch and replace.

- d) Position the door switch so that it will be activated by the actuator rod when the door is closed and tighten screws.
- e) Close the lint door.

LINT DOOR SWITCH (15, 20 & 25 lb. dryers only unless special ordered): This switch is located in the rear lower right hand corner of the front panel and breaks the motor and heating unit circuit when the lint door is opened. The meter indicator lights, and the pilot remain on. (See illustration page 4-10.)

- TO REPLACE OR ADJUST:
- a) Turn power off.
  - b) Open the lint door for accessibility to the lint door switch (13).
  - c) If an adjustment is needed, loosen the bezel nuts (14) holding the switch to the front panel. If the switch is defective, disconnect the wire leads from switch and replace.
  - d) Adjust the rear bezel nut so the switch will be activated when the lint door is closed and tighten the front nut.
  - e) Close the lint door.

TEMPERATURE CONTROL SNAP ACTION THERMOSTATS: These thermostats will open or close the circuit to the heating unit when their preset temperatures are reached. The thermostats are located under the right wrapper. (See illustration 4-9 or 4-31 for prior production. For current production see illustration page 4-35.)

- TO REPLACE: BE SURE ELECTRICAL POWER IS OFF BEFORE ATTEMPTING TO REPLACE.
- a) Open Lint door for accessibility to the thermostat group.
  - b) Loosen screws (11), slide bracket assembly (2) to rear and pull away from support.
  - c) Disconnect the wiring to the defective thermostat and remove.
  - d) Remove screws (1) retaining defective thermostat (4) or (5) and remove thermostat.
  - e) Replace the thermostat by reversing the removal procedure.

HI HEAT OVERLOAD PROTECTOR: This thermostat will open the heating unit circuit if an excessive temperature occurs due to a failure of either of the excessive temperature control snap action thermostats. The clock, motor, indicator lights, and pilot will remain on. This thermostat is a hi temp protector and only operates on and off in the event the regular thermostats should fail. The dryer will operate at higher temperatures, and corrective measures should be taken. See Temperature Control Snap Action Thermostats in this section. (See illustration 4-9 or 4-31 for prior production. For current production see page 4-35.)

TO REPLACE: BE SURE ELECTRICAL POWER IS OFF BEFORE ATTEMPTING TO REPLACE.

- a) Follow same procedure as shown in this section for replacement of temperature control snap action thermostats.

HIGH LIMIT SNAP ACTION THERMOSTAT: This thermostat is located on the left side of the gas burner (see illustration page 4-18) and on the rear of the electric oven (see page 4-20). This thermostat serves as an added precaution against failure of the air switch to open in the event of a motor failure or a reduced draft condition.

TO REPLACE:

- a) Turn power off
- b) Remove the high limit thermostat cover (1).
- c) Disconnect the leads from the thermostat (4).
- d) Remove the screws (3) holding the thermostat (4).
- e) Replace by reversing the removal procedure.

SAIL SWITCH: This switch controls the burner circuit only and is located in the rear of the burner on the gas models and on the front of the oven on electric models. When the dryer is operating and there is a proper air flow, the sail switch damper is sucked in closing the circuit and the burners ignite. If an improper air flow occurs the damper will be released and the circuit will open. (See illustration page 4-30.)

TO REPLACE:

- a) Turn power off.
- b) Remove the two screws (13) which hold the sail switch box (10) to the rear of the burner box.
- c) Disconnect the leads from the sail switch (5).
- d) Remove the two screws (12) which hold the sail switch mounting bracket (6) to the sail switch box.
- e) Remove the two screws (4) which hold the sail switch to the sail mounting bracket.
- f) Replace by reversing the removal procedure.

TO ADJUST: With the dryer operating on heat, bend the actuator arm of the switch (5). Pull sail wire support arm (11) away from the burner to a vertical hanging position. The switch should open and extinguish the burner. Let the sail (9) return to the burner wall. The sail switch, should close to reignite the burner. Check the proper open position of the switch by opening the loading door and depressing the loading door switch to keep the machine operating. The burner should remain extinguished until the door is closed. CAUTION: Do not abort this switch by taping or screwing sail to burner. This switch should be checked periodically for proper opening to reduce the hazard of fire.

GAS VALVE SOLENOID: The solenoid is actuated by the snap action thermostats and turns the main burners on or off. This solenoid may not necessarily be defective if the main burners do not go on. (See illustration page 4-18, and paragraph H page 3-17.)

TO REPLACE:

- a) Turn power off.
- b) If applicable disconnect the solenoid wire leads from the terminal board and remove the BX fitting (28) from the wiring box, (earlier production models).
- c) Remove the four screws which hold the solenoid (29) to the valve body (31).
- d) If applicable remove the BX (27) off the wires of the defective solenoid and on to the wires of the new solenoid.
- e) Replace new solenoid utilizing a new gasket and reversing the removal procedure.
- f) Check for gas leakage with a soapy solution.

PILOT: The pilot operates as follows: the thermocouple when heated holds the automatic valve open. If the pilot blows out, the thermocouple cools, and closes the pilot valve. This prevents the gas from being turned on without igniting. If the pilot will not remain lit, check the thermocouple output. If this is adequate, then the pilot valve is defective. If the pilot flame is very low, the pilot line filter may need to be replaced. (See illustration page 4-18.)

TO REPLACE:

- a) Turn power off.
- b) Disconnect the thermocouple (16) and the pilot gas supply line (17) from the pilot valve (30).
- c) Remove the four screws which hold the pilot valve to the valve body (31).
- d) Replace with new automatic pilot reset valve utilizing a new gasket and reversing the removal procedure.

THERMOCOUPLE: The thermocouple should generate a minimum of 15 millivolts to keep the pilot reset valve open. In normal operation it generates 20 to 25 millivolts. If the output of the thermocouple is low, it should be replaced. Millivoltmeters are available. (See parts price list part number 168000.) (See illustration page 4-18.)

TO REPLACE:

- a) Turn power and gas off.
- b) Disconnect the thermocouple (16) and the pilot gas supply line (17).
- c) Remove the two screws (23).
- d) Work pilot burner assembly (14) free through the opening between the main burners (11).
- e) Remove the thermocouple and replace by reversing the above procedure.

PRESSURE REGULATOR: All gas dryers are equipped with pressure regulators, except L.P. gas dryers. The pressure regulator insures that the rate of gas consumption is constant. The pressure regulator is preset to 3 1/2" W.C. manifold pressure for natural gas. There is a manifold pressure tap just below the solenoid. Remove the plug and connect a manometer or pressure gauge. A pressure gauge is available from the factory (P/N 168100). To adjust manifold pressure remove cap screw from the regulator well. Turn the slotted head adjustment screw in the well clockwise to increase manifold pressure (counter clockwise to decrease pressure). Replace cap screw. A conversion kit to modify the gas valve, burner and pilot to utilize a different gas is available from the factory.

BURNER ASSEMBLY: The main burners themselves should need no attention during the life of the dryer. But if there is any change in the rating of the gas BTU per cubic foot or specific gravity, the pilot and main burner orifice may have to be changed. If converting any dryer from one gas to another such as natural gas to L.P. gas or L.P. gas to manufactured gas, the pilot orifice and the main burner orifice will have to be changed according to Tables 1 and 2 in Section V. A filter on the pilot gas supply line is required on some models. Field kits are available from the factory to make these conversions. (See illustration page 4-18.)

TO REPLACE THE  
MAIN BURNER ORIFICES:

- a) Turn gas supply and power off.
- b) Disconnect the gas supply line and remove the two screws (5) holding the pipe bracket (9) on the front right hand side of the burner box (8).
- c) Remove the two screws (5) holding the manifold bracket (25) to the front of the burner box.
- d) Disconnect the thermocouple (16) and the pilot gas supply line (17) from the pilot valve (30).
- e) Pull the valve and manifold (26) assembly forward and unscrew the main burner orifices (22) and replace. (See Table No. 1 in Section V.)

- f) Reverse the removal procedure for re-installing.

PILOT ORIFICE: The small opening of the pilot orifice can easily be clogged if there is any foreign matter in the line. It is possible to clean the orifice by using compressed air or washing out. If this fails the orifice should be replaced. The size is stamped on the side of the orifice. (See Table No. 2 in Section V. See Page 3-10 for Pilot Orifice replacement.)

DO NOT USE ANY INSTRUMENTS OR TOOLS TO CLEAN ORIFICES.

MOTOR: All motors are equipped with internal thermal overload protection, which stops the motor whenever it becomes overheated. Causes of possible overheating are: overloading tumbler, restricted air circulation around the motor, lint blockage of motor frame vents. If the motor overheats, corrective action must be taken. If a motor is suspected of being defective, remove drive belt, remove the plate on the back of the motor and connect motor directly to the line voltage. (See illustration Page 4-12.)

TO REPLACE:

- a) Turn power off.
- b) Remove the V-belt (5) from the motor (9).
- c) Disconnect the wiring harness (4) from the motor.
- d) Remove the four nuts (11) holding the motor mount to the dryer and remove.
- e) Remove the two nuts (18) on the motor shaft (L.H. thread-turn clockwise) and work impeller (16) free from motor shaft by means of an impeller puller (Part #880400) to prevent damage to the motor shaft.
- f) Loosen set screw on the sheave (6) and remove the sheave and key (7).
- g) Remove the four bolts (2) holding the motor to the motor mount and replace with a new motor by reversing the removal procedure. See page 3-12 for belt adjustment if required.

IMPELLER: The impeller is fastened to the motor shaft and should need no replacement for the life of the dryer unless damaged.

TO REPLACE: Follow motor replacement procedure steps d & g.

VERTICAL ALIGNMENT OF  
TUMBLER:

(See illustrations page 4-15/4-16.)

- a) Loosen the four bolts (6)/(9) on the sides of the bearing box (9)/(11).
- b) Back off jam nuts (5)/(7) on adjustment screws (8)/(12).
- c) Turn the screws (8)/(12) clockwise evenly to raise tumbler or counter clockwise to lower tumbler.

- d) Rotate tumbler from front and check alignment with opening.
- e) Leave a larger gap from the inside rim of the front panel opening to the basket on the top and a smaller gap on the bottom to compensate for the additional weight of clothing.
- f) Tighten the two bolts (6)/(9) on the sides of the bearing box and tighten the jam nuts to the adjustment bolts.
- g) Check tumbler drive belt for proper tension. Adjust if required.

LATERAL ALIGNMENT

OF TUMBLER: 30#, 35#, 50#, 60# and 65# Only.

- a) Loosen the two bolts (4) 1 1/2-1 turn holding the pillow block bearing (6) to the bearing box (11).
- b) Back off the jam nuts (7) on the side adjustment bolts (10). Adjust bolts to move the tumbler laterally. Rotate tumbler from front and check alignment with opening. The spacing between the tumbler and the inside rim of the front panel should be equal.
- c) Tighten the bolts holding the pillow block bearing and tighten the jam nuts on the adjustment bolts.

TO REPLACE TUMBLER

OR TUMBLER SUPPORT: (See illustrations page 4-10/4-35.)

1. REMOVAL OF FRONT PANEL

- a) Turn power off and disconnect the meter (2) or the timer wires from the terminal board.
- b) Disconnect the push button wiring harness from the terminal board (earlier models). Disconnect the rocker switch (16) and indicator light leads (15).
- c) Disconnect plug (10) to thermostat group and disconnect wire leads from thermostat and door switch(es) at terminal board, or...
- d) Disconnect the two leads coming from the rear of the dryer to the switch(es) (10).
- e) Remove the two screws (3) on the top corner of the front panel (5).
- f) Remove the two screws (3) in the control door chamber.
- g) Remove the four screws (6) on the front panel. Remove front panel.

2. REMOVAL OF BACKGUARD
  - a) Remove nuts (4).
  - b) Remove backguard (5).

3. REMOVAL OF THE 18" PULLEY  
(See illustration page 4-15.)

- a) Rotate pulley (11) and roll V-belt (10) out of groove.
- b) Remove bolt (6) from the back of pulley.
- c) Loosen pulley set screws.
- d) Remove pulley and key (12).
- e) Replace by reversing removal procedure.

4. REMOVAL OF TUMBLER ASSEMBLY AND TUMBLER SUPPORT

(See illustration page 4-15/4-16.)

- a) Loosen the two set screws on both bearings (4) (page 4-15) (15#, 20# and 25# dryers) and remove ring from shaft. These can be reached through the opening on bottom of bearing housing, or...
- b) Loosen the two set screws on both bearings (1)/(6) (page 4-16) (30#, 35#, 50# and 60# dryers). The two set screws on the pillow block bearing (6) can be reached from the top of the bearing. The two set screws on the 1 3/8" flange bearing (1) can be reached through the opening on bottom of bearing housing.
- c) Remove the tumbler and the tumbler support assembly from the dryer. If the tumbler cannot be removed freely, strike the end of the shaft with a mallet and block to move shaft past burrs made by set screws.  
**NEVER STRIKE END OF SHAFT WITH A HAMMER DIRECTLY.**  
Remove tumbler.

5. REMOVAL OF TUMBLER FROM TUMBLER SUPPORT

(See illustration page 4-17.)

- a) Remove screw (5) in the center of tumbler backwall (4).
- b) Remove tie rods (6).
- c) Replace either tumbler (4) or tumbler support (3).
- d) Reverse the removal procedure for re-installing.

**BEARINGS:** Bearings are sealed and need no lubrication. If replacement is needed follow the replacement instruction outlined on the next page for the faulty bearing.

TO REPLACE THE REAR 1" FLANGE BEARING:

(15#, 20# and 25# Dryers) (See illustration page 4-15.)

- a) Follow steps 2 and 3 of the replacement of tumbler and tumbler support.
- b) Remove the three nuts (5) holding rear flange bearing (4) to bearing housing (9).
- c) Loosen the two set screws on the rear flange bearing (4), and remove.

TO REPLACE THE FRONT 1 1/4" FLANGE BEARING:

(15#, 20# and 25# Dryers) (See illustration page 4-15.)

- a) Follow steps a through c, from replacement of 1 1/4 " flange bearing.
- b) Remove the four bolts (6) on the sides of bearing housing (9) and remove.
- c) Remove the three nuts (5) holding the front flange bearing to dryer.
- d) Loosen the two set screws on the front flange bearing (4) and remove.
- e) Reverse the removal procedure for re-installing.
- f) Realign tumbler. (See tumbler alignment page 3-8.)

TO REPLACE THE REAR PILLOW BLOCK BEARING:

(30#, 35#, 50#, 60# and 65# Dryers) (See illustration page 4-16.)

- a) Follow steps 2 and 3 from replacement of the tumbler and tumbler support.
- b) Loosen jam nuts (7) and adjustment screws (10).
- c) Loosen set screws from rear bearings (6).
- d) Remove the two bolts (4) holding the pillow block bearing (6) to bearing housing (11) and remove.
- e) Replace by reversing the removal procedure.

TO REPLACE THE 1 3/8" FRONT FLANGE BEARING:

(30#, 35#, 50#, 60# and 65# Dryers) (See illustration page 4-16.)

- a) Follow steps a through d from replacement of the rear pillow block bearing.
- b) Remove the four bolts (9) on the sides of the bearing housing (11) and remove.
- c) Remove the four nuts (3) holding the front flange bearing (1) to the dryer.
- d) Loosen the two set screws on the front flange bearing (1) and remove.

- e) Replace and reverse the removal procedure for reinstalling.
- f) Realign tumbler. (See tumbler alignment in this section.)

V-BELTS: V-Belts should have a proper tension. If too loose they will slip, if too tight, excessive wear on the bearings results. If the pulleys are not properly aligned, excessive belt wear results.

TO ALIGN BELTS: (See illustration page 4-12.)

- a) Loosen set screw on motor sheave (6). Since the 18" pulley should be flush with the end of the shaft and the idler pulley is self aligning, position the motor sheave so belts ride evenly on pulleys.
- b) Reposition key as required and tighten set screw.

BELT TENSION ADJUSTMENT: (See illustration page 4-14.)

- a) Loosen the two bolts (7)(8) on the adjustment block (6).
- b) Back off jam nut (1) on the adjustment screw (5) and loosen/tighten screw to relax/increase belt tension.
- c) Tighten bolts on adjustment block.
- d) Tighten jam nut on the adjustment block.

18" PULLEY: Replacement of the 18" pulley is explained under tumbler and tumbler support page 3-9.

IDLER PULLEY: (See illustration page 4-14.)

- a) Rotate 18" pulley and roll belt (9) out of groove.
- b) Rotate idler pulley (10) and roll belt (12) out of groove.
- c) Remove idler pulley from shaft.
- d) Replace by reversing removal procedure.

REPLACEMENT OF MAIN DOOR GLASS AND GASKET:

(See illustration page 4-4.) A dull rounded blade made of a plastic or hardwood should be used to avoid scratching the glass or tearing the gasket.

- a) Open door and roll inside lip of gasket (9) away from glass (10) starting at the end seam (bottom). Probe the blade under edge of glass and advance tool around the glass.

- b) Pull gasket off the edge of the door (2) cutout.
- c) Examine end of extruded gasket. Starting at bottom of circle insert edge of door cutout into the thin slot of gasket with the thick slot for the glass toward the inside or rear of door. Press gasket into place around cutout. Do not cut access length from gasket. Work gasket around circle until ends butt neatly.
- d) Press edge of glass firmly into wide gasket slot at bottom and work glass into slot with tool inserted between rear surface of glass and gasket lip. Advance tool around the gasket while pressing edge of glass into slot.
- e) Work butt ends of gasket to obtain a neat, tight joint.

LINT SCREEN: (See illustration page 4-7 and 4-8.)

- a) Remove screws (4) and lint screen retainer.
- b) Remove screen (2).

LOCKS:

- a) Remove screw holding pawl.
- b) Slide retaining spring away from lock.
- c) Remove lock.
- d) Replace by reversing removal procedure.

PILOT ORIFICE REPLACEMENT

TO REPLACE PILOT ORIFICE: (See illustration page 4-18.)

- a) Turn gas and power off.
- b) Disconnect the thermocouple (16) and the pilot gas supply line (17) from the pilot valve (30).
- c) Remove screws (23).
- d) Work pilot assembly (14) free through the opening between the main burner (11).
- e) Remove the pilot gas supply line (17) from the pilot orifice (15).

- f) Remove the pilot orifice (15) from the pilot (14).
- g) Replace by reversing the removal procedure.

**ELECTRIC HEATING ELEMENT:** This element produces heat in the electric oven to dry the clothes. This element is rated at 3KW, 4KW, and 5KW at 208V or 240V. The quantity and rating will vary for different ovens. (The rating is stamped on the frame of the element.) (See illustration page 4-20.)

**TO REPLACE:**

- a) Turn power off.
- b) Remove screws (20) and electric oven rear cover (21).
- c) Disassemble terminal hardware (27) through (32) from both terminals of defective element (2).
- d) Remove sail hanger (12) from sail switch housing (13).
- e) Remove screws holding cover plate (3).
- f) Remove cover plate and slide out defective element.
- g) Replace element by reversing removal procedure.

**ELECTRIC RELAY CONTACTOR:** The relay contactor controls power to the electric oven. (See illustration page 4-20.)

**TO REPLACE:**

- a) Turn power off.
- b) Remove rear cover screws (20) and cover (21).
- c) Remove side cover screws (20) and cover (25). Disconnect all wire leads.
- d) Remove contactor mounting nuts (22) and relay contactor (24).
- e) Remove nuts holding contactor to its mounting plate. See page 4-22 (7), (8) and (4).)
- f) Replace by reversing removal procedures.
- g) To replace a defective coil only, refer to Furnas Instruction Sheet.

## TROUBLE CHART

### TROUBLE

### PROBABLE CAUSE AND REMEDY

- A. The dryer does not turn on.
  - (1) Check power supply fuses or circuit breaker.
  - (2) The power supply voltage does not correspond to the voltage indicated on the dryer data plate.
  - (3) The timer or the coin meter circuit is open, or the timer or coin meter is defective. See Page 3-2.
  - (4) The main door switch linkage is not functioning properly or the main door switch is defective. See Page 3-2. (Timer models only)
  - (5) Check wiring for an open circuit or faulty connection.
  
- B. The dryer starts but tumbler won't revolve.
  - (1) Contaminated by oils, worn or loose V-Belt. See Page 3-9.
  - (2) Motor sheave is loose. See Page 3-9.
  - (3) Basket is overloaded.
  - (4) Belt is riding in the bottom of the motor sheave groove.
  
- C. The dryer starts and tumbler revolves, but heating unit does not operate.
  - (1) Lint door is open (models not equipped with switch only).
  - (2) Sail switch is open, out of adjustment, or defective. See Page 3-4.
  - (3) A defective relay contactor coil (electric dryers).
  - (4) The electric power to the heating unit is disconnected.
  - (5) The gas is turned off.
  - (6) The pilot flame is out. See Section III, Part H.
  - (7) The main burner will not go on. See Section III, Part I (1), (2), (4), (5).
  - (8) Restricted gas supply.
  - (9) Defective high and low snap action thermostat. See Page 3-3.
  - (10) A defective hi-limit thermostat. See Page 3-4.
  
- D. Slow drying (full load).
  - (1) The gas supply line may be inadequate to produce full rated gas input.
  - (2) The dryer is being overloaded.
  - (3) Partial belt slippage.
  - (4) Insufficient make-up air. See Page 5-3.

## TROUBLE CHART

### TROUBLE

### PROBABLE CAUSE AND REMEDY

- |  |   |
|--|---|
|  | (5) Loading door or lint door is not fully closed. Seals missing, doors deformed.   |
|  | (6) Extractor(s) not performing properly.   |
|  | (7) An inadequate exhausting system. See Page 5-5.  |
|  | (8) The lint screen is blocked or dirty. See Page 2-1.  |
|  | (9) An exceptionally cold, humid room atmosphere.   |
| E. Slow drying (part load)                           | Same as D(4) through D(8).  |
| F. The dryer is overheating.                         | (1) The high or low snap action thermostat is defective. See Page 3-3.<br>(2) High gas pressure: check the gas pressure and adjust to the table on Page 5-5.<br>(3) Wrong type of gas for dryer. See nameplate.   |
| G. The dryer won't stop.                             | (1) Timer or meter is defective. See Page 3-2.  |
| H. The pilot won't light or will not stay lit.       | (1) The gas is turned off.<br>(2) The pilot orifice is blocked or partially blocked. See Page 3-6.<br>(3) The filter is blocked or partially blocked. Replace.<br>(4) Defective thermocouple. See Page 3-5.<br>(5) Defective pilot valve. See Page 3-5.<br>(6) A severe external draft. |
| I. The main burner will not light.                   | (1) A defective gas valve solenoid. See Page 3-4.<br>(2) An open solenoid circuit. See Page 3-4.<br>(3) Sail switch is out of adjustment or defective. See Page 3-2.  |
| J. The main burners are burning with a yellow flame. | (1) Air shutters need adjusting. See Page 1-1.<br>(2) The burners are dirty.<br>(3) A high gas pressure. See Section III, Trouble Chart Part F(3).<br>(4) Wrong type of gas for dryer. See nameplate.   |

## TROUBLE CHART

### TROUBLE

### PROBABLE CAUSE AND REMEDY

- |   |  |
|---|--|
| K. A premature motor burn out.                        | (1) A low supply voltage: have electrician check voltage.<br>(2) V-Belts are set too tight. See Page 3-9.<br>(3) The dryer is being overloaded.<br>(4) The motor wired incorrectly.<br>(5) Voltage supply is different from nameplate voltage.             |
| L. An excessive noise or vibration in the dryer.      | (1) The dryer is not level. See Page 1-1.<br>(2) The basket is out of adjustment. See Page 3-7.<br>(3) The V-Belts are too loose or too tight. See Page 3-9.<br>(4) Bearing or pulley set screws are loose or keys are worn or loose in keyways of shafts. |
| M. The dryer is cycling on the high limit thermostat. | (1) An inadequate air flow. See Page 5-5.<br>(2) Sail switch out of adjustment or defective.   |
| N. The motor starts and stops.                        | (1) The thermal overload is tripping the motor. See Page 3-6.  |

**IMPORTANT:**

When ordering parts specify: Dryer Model Number and Serial Number in addition to the Part Number so we can fill your order accurately and promptly.

## HEAT RECLAIMER MODELS (GAS)

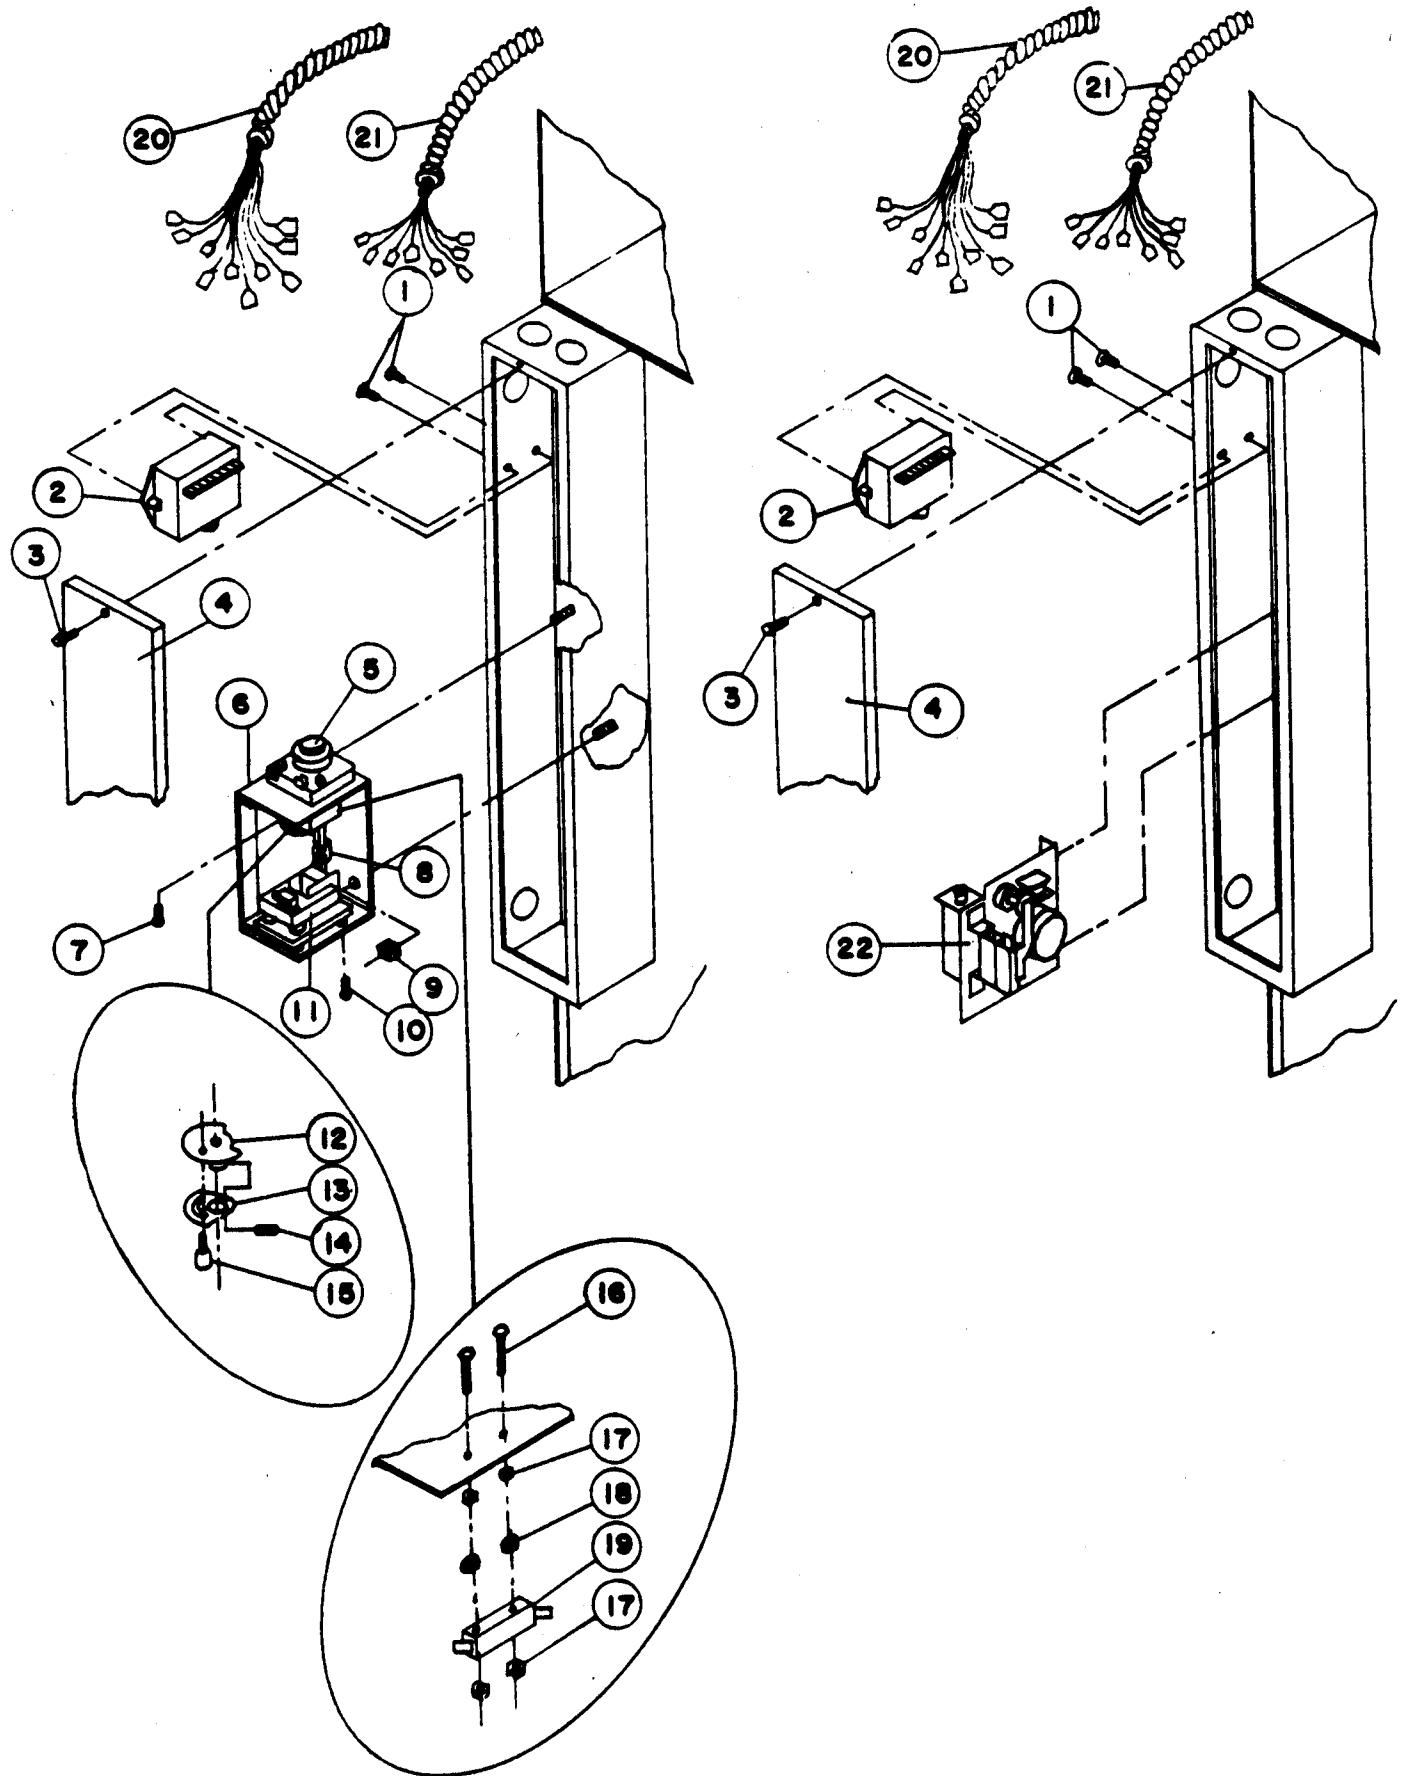

All gas models are available with a Heat Reclaimer and Glo-Bar II electric automatic ignition as optional equipment. Up to 45% gas savings may be realized.

A portion of the hot exhaust air is recirculated via the rear duct into the separate bonnet and flue passages where it is preheated by the hotter make-up air from the burners, and then returned to the tumbler compartment. The rear panels of the recirculating duct are removable for periodic cleaning. (It is suggested the recirculating duct be cleaned at least every thirty hours of dryer operation.)

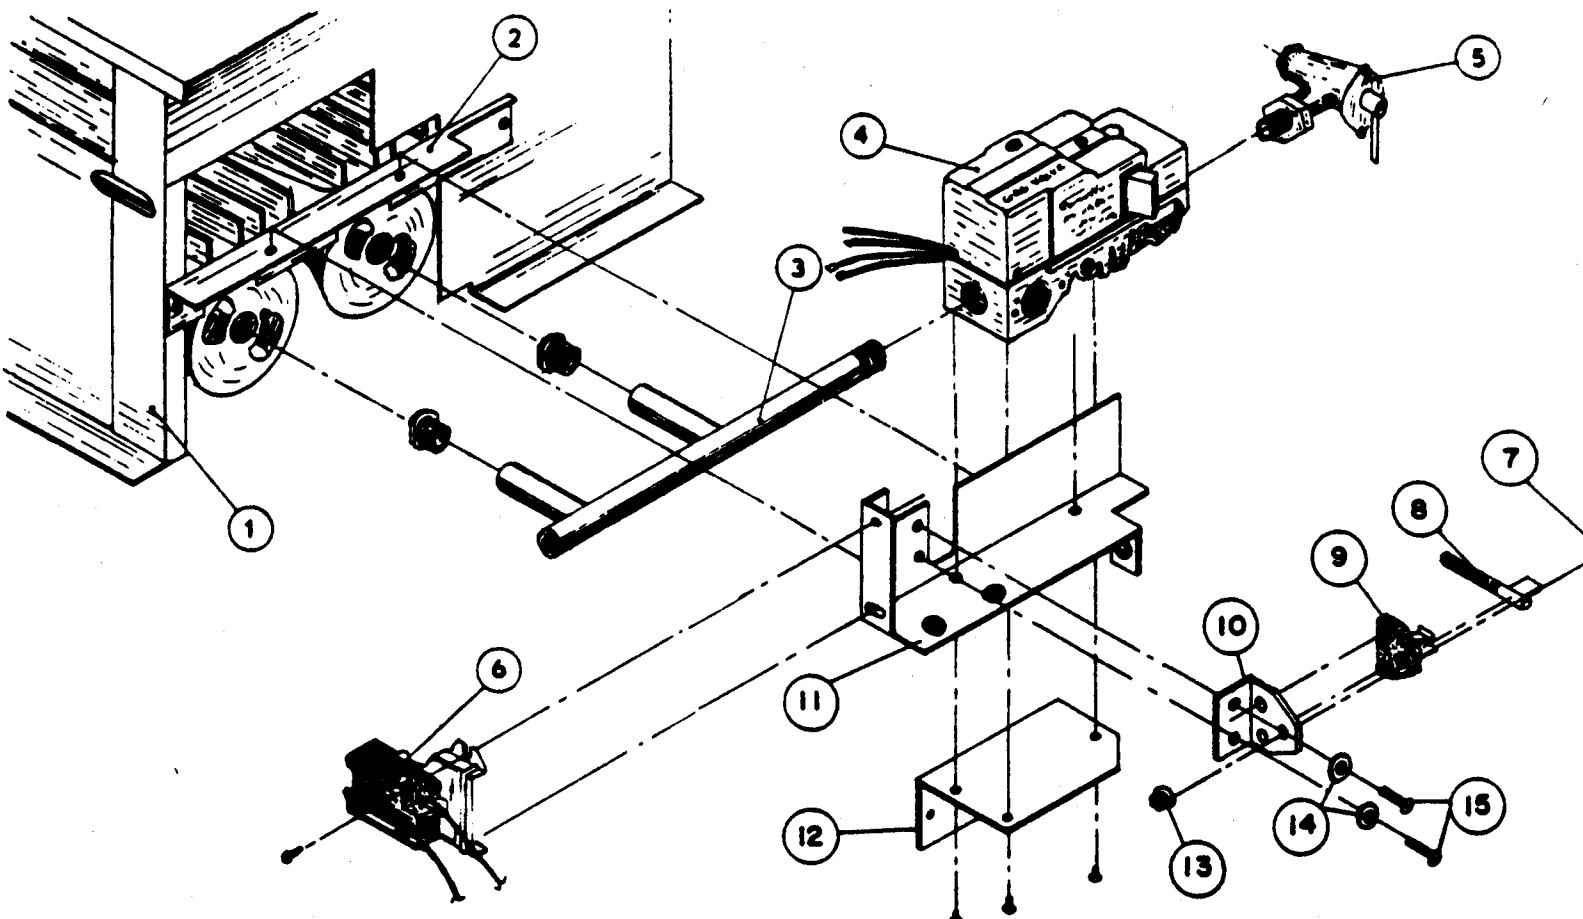

The lower access panel is also provided with a back draft damper and an adjustable splitter plate. The splitter is provided with screw holes for three different positions. It is installed at the factory in the position most suitable for the usual exhaust duct installations of most laundries.

If the duct path is longer than normal, the splitter should be repositioned to the right (as viewed from the rear); to the left for very short exhaust duct paths (which may also provide greater heat savings). Optimum fuel savings can be realized for a particular exhaust duct installation by other positions of the splitter.

**IMPORTANT:** Always check the operation of the sail switch to insure its proper function without flutter.

# METER & TIMER SECTION

## Electric Timers

124000 60 Min. Timer - 110V  
 124001 60 Min. Timer - 220V  
 124002 30 Min. Timer - 110V  
 124003 30 Min. Timer - 220V  
 124004 15 Min. Timer - 110V  
 124005 15 Min. Timer - 220V

## Timer Knobs

124100 60 Min. Timer Knob  
 124101 30 Min. Timer Knob  
 124102 15 Min. Timer Knob  
 124103 Arrow Timer Knob

## Buzzer

124800 Buzzer 110V  
 124801 Buzzer 220V

## Perma Press Meters

125000 25c/30 Min. P.P. 110V Meter  
 125001 10c/10 Min. P.P. 110V Meter  
 125002 5c/5 Min. P.P. 110V Meter  
 125003 25c/30 Min. P.P. 220V Meter  
 125004 10c/10 Min. P.P. 220V Meter  
 125005 5c/5 Min. P.P. 220V Meter  
 125300 Dual Coin P.P. Meter 110V  
 125301 Dual Coin P.P. Meter 220V  
 125400 35c To Start P.P. Meter 110V  
 125401 35c To Start P.P. Meter 220V

## Cool Down Meters

125100 25c/30 Min. C.D. 110V Meter  
 125101 10c/10 Min. C.D. 110V Meter  
 125102 5c/5 Min. C.D. 110V Meter  
 125103 25c/30 Min. C.D. 220V Meter  
 125104 10c/10 Min. C.D. 220V Meter  
 125105 5c/5 Min. C.D. 220V Meter

## Timer Labels

112003 60 Min. Timer Label  
 112004 60 Min. Timer Label C.D.  
 112005 60 Min. Timer Label Buzzer  
 112008 30 Min. Timer Label C.D.  
 112010 Dual Timer Label 60-15

## Reg. Meters

125200 25c/30 Min. Reg. 110V Meter  
 125201 10c/10 Min. Reg. 110V Meter  
 125202 5c/5 Min. Reg. 110V Meter  
 125203 25c/30 Min. Reg. 220V Meter  
 125204 10c/10 Min. Reg. 220V Meter  
 125205 5c/5 Min. Reg. 220V Meter

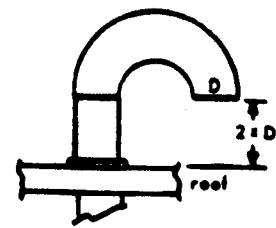

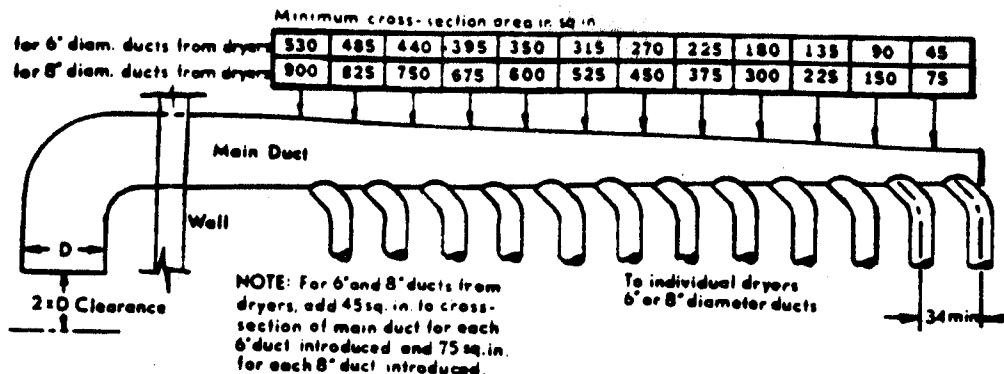

Fig. 2

Figure 1

**EXHAUST DUCT AND AIR INTAKE.** Where possible, it is desirable to provide a separate exhaust air duct for each dryer. The duct should be 6" to 8" in diameter, depending upon the air outlet diameter of the dryer. The duct should go as directly as possible to the outside air. Avoid right angle turns in the ducting; use 30 degree or 45 degree angles instead. The radius of the elbows should preferably be 1 1/2 times the diameter of the duct.

To protect the outside end of the duct from the weather, it may be bent downward as indicated in Figure 1. Leave at least twice the diameter of the duct clear between the duct opening and the nearest obstruction. If the exhaust duct goes through the roof, it may be protected from the weather by a hood, or by using a 180 degree turn to point the opening down. In either case, allow at least twice the diameter of the duct as clearance from the nearest obstruction as indicated above.

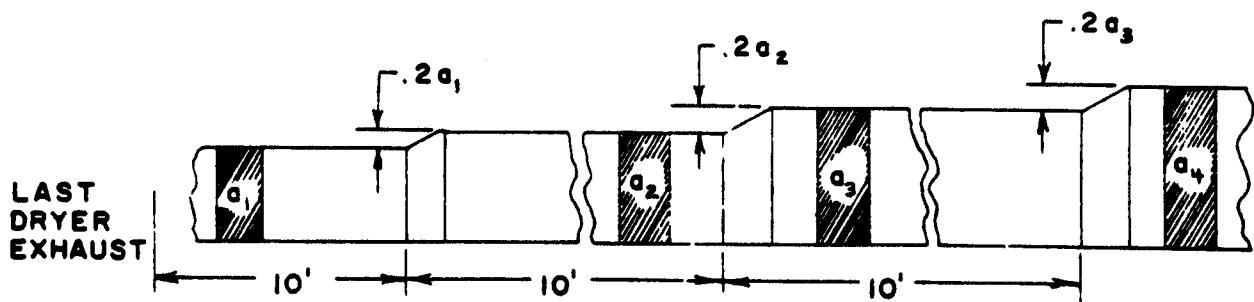

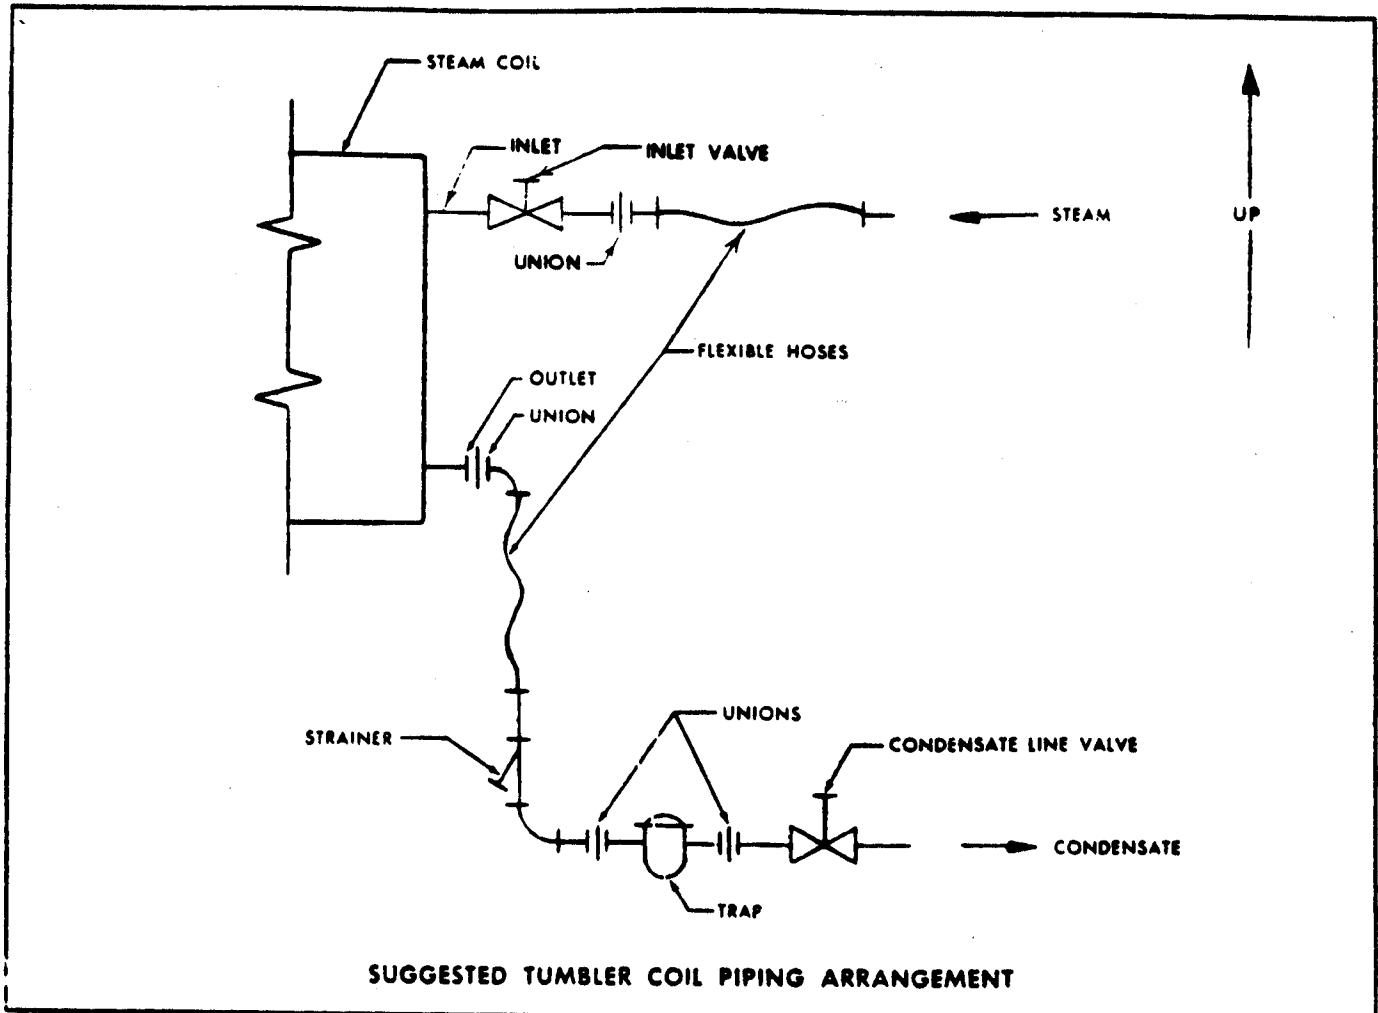

Do not use screens or caps on the outside opening of the exhaust duct. The ducting should be smooth inside, with no projections from sheet metal screws or other obstructions which will collect lint. When adding ducts, the duct to be added should overlap the duct that it is to be connected to. Provide inspection doors for periodic clean-out of lint from the main duct.

If it is not feasible to provide separate exhaust ducts for each dryer, ducts from the individual dryers may be channeled into a common main duct. The individual ducts should enter the bottom or side of the main duct at an angle not more than 45 degrees and should be spaced at least 34" apart. The main duct should be tapered, with the diameter increasing before each individual duct is added. The minimum increase in cross-section area should be 45 square inches for each 6" duct added, and 75 square inches for each 8" duct added. The main duct may be any shape of cross section so long as the minimum cross section area is provided. Figure 1 shows the minimum cross section areas of the main duct for either 6" or 8" dryer ducts. These figures should be increased if the main duct is unusually long (20' or over) or has numerous elbows in it.

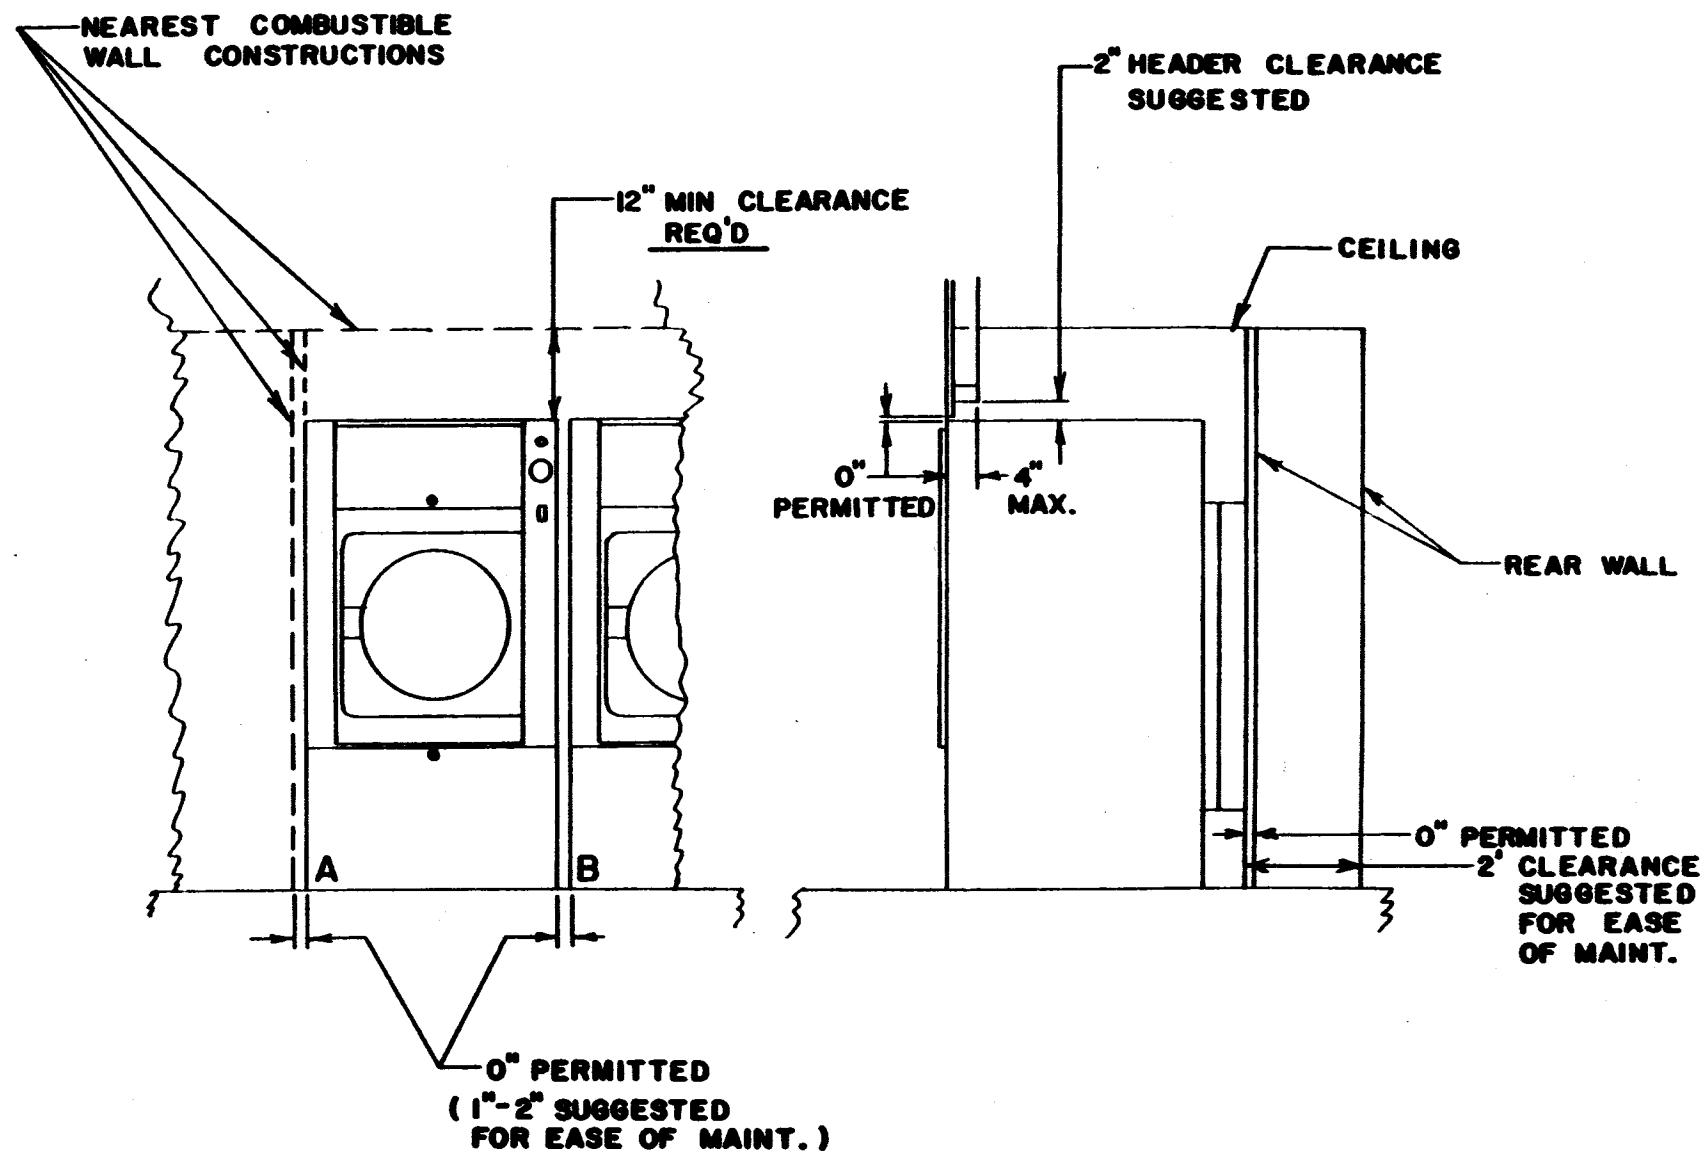

An opening from the outside air, to the room in which the dryers are operating, should be provided for make-up air. This should be approximately two to three times the cross-section area of the total of the exhaust ducts.\*

Inadequate exhaust facilities may cause high temperature limit switches or air flow switches to shut off the dryers. Do not disable the switches, which are provided for your safety. Instead, investigate the exhaust ducting. Any obstruction, or air friction due to bends in the ducting, will cause back-pressure and slow the passage of air through the system with resulting inefficiency and fire hazard.

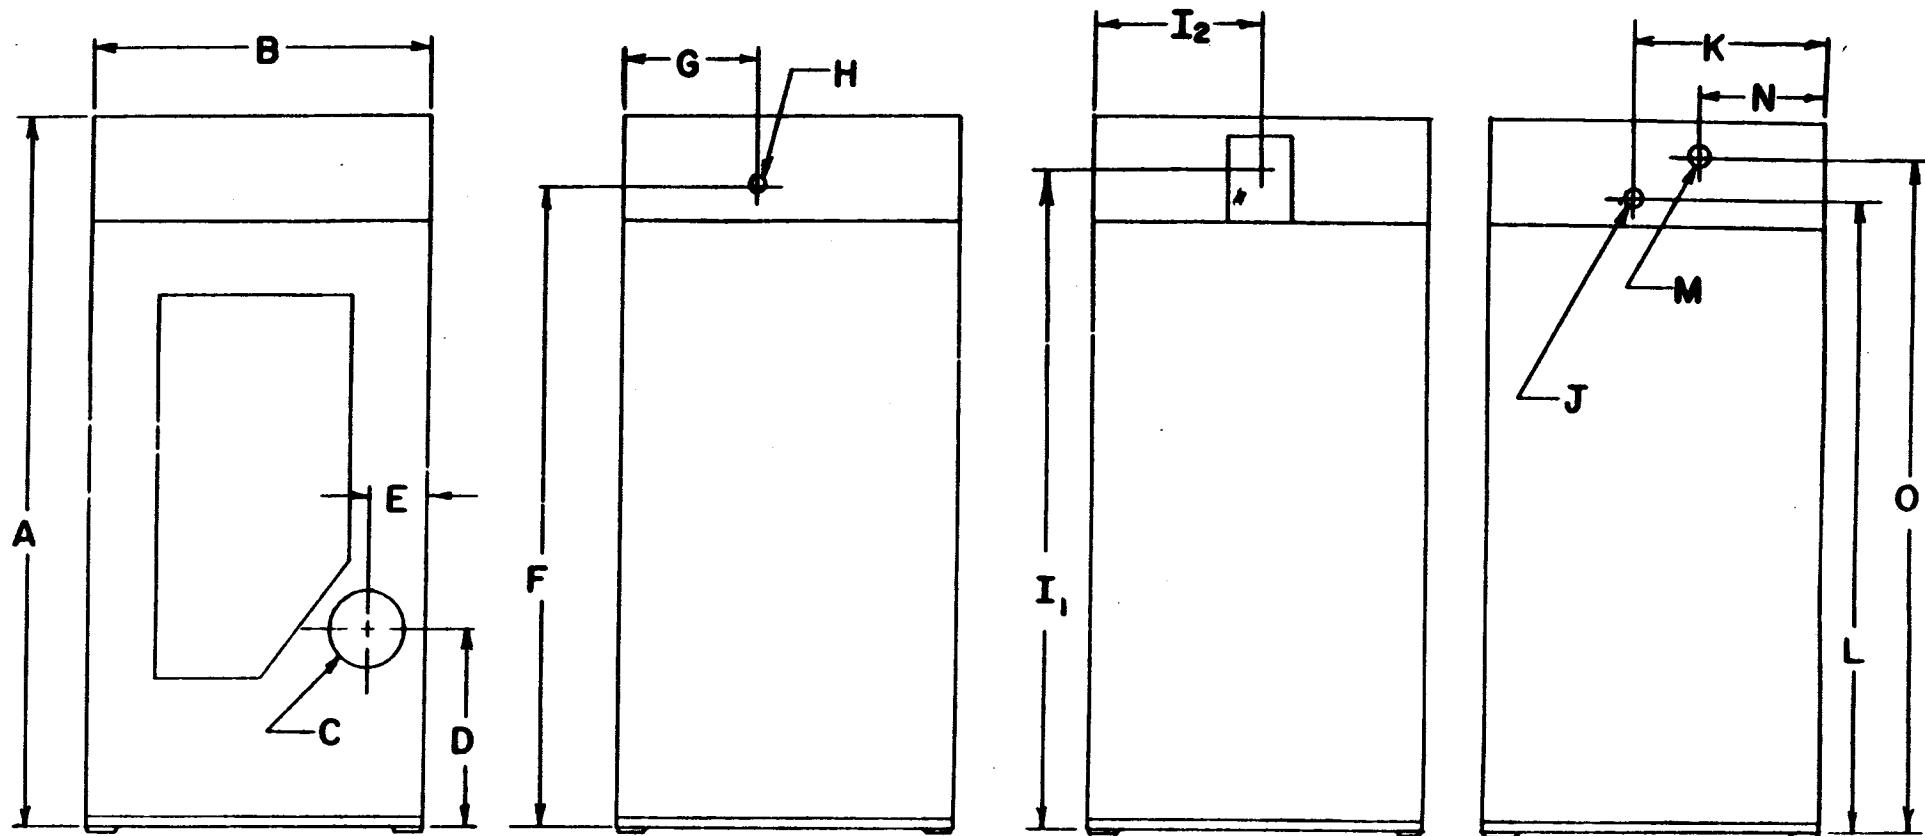

\*For steam dryers, the area should be from four to five times the total area of the exhaust duct.

**INCREASE OF DUCT AREA FOR LONG EXHAUST DUCT INSTALLATIONS.**
