

OPERATING & MAINTENANCE MANUAL

S 28 EX 7 - S 28 EX 10

471 1562-88/95.01
From machine No. 93/38450–

WARNING: ALL OPERATING AND MAINTENANCE PROCEDURES SHOWN ON THE NEXT PAGE OF THIS MANUAL MUST BE FOLLOWED DAILY FOR PROPER OPERATION OF YOUR WASCOMAT MACHINE.

PLEASE ENTER THE FOLLOWING INFORMATION AS IT APPEARS ON THE MACHINE(S) DATA PLATE(S).

MACHINE TYPE OR MODEL	
MACHINE SERIAL NUMBER(S)	
ELECTRICAL CHARACTERISTICS: _____ VOLTS, _____ PHASE, _____ HZ.	

MAKE CERTAIN TO KEEP THIS MANUAL IN A SECURE PLACE FOR FUTURE REFERENCE.

NOTICE TO: OWNERS, OPERATORS AND DEALERS OF WASCOMAT MACHINES

IMPROPER INSTALLATION AND INADEQUATE MAINTENANCE, POOR HOUSEKEEPING AND WILLFUL NEGLECT OR BYPASSING OF SAFETY DEVICES MAY RESULT IN SERIOUS ACCIDENTS OR INJURY. TO ASSURE THE SAFETY OF CUSTOMERS AND/OR OPERATORS OF YOUR MACHINE, THE FOLLOWING MAINTENANCE CHECKS MUST BE PERFORMED ON A DAILY BASIS.

1. Prior to operation of the machine, check to make certain that all operating instructions and warning signs are affixed to the machine and legible. (See the following page of this manual for description and location of the signs.) Missing or illegible ones must be replaced immediately. Be sure you have spare signs and labels available at all times. These can be obtained from your dealer or Wascomat.

2. Check the door safety interlock, as follows:

- (a) OPEN THE DOOR of the machine and attempt to start in the normal manner:

For coin-operated models, insert the proper coins to start the machine.

For manually operated models, place the ON-OFF switch in the ON position and press the Start switch.

For FL and EX models, insert a program card, turn the starter knob to the Start position and place the ON-OFF switch in the ON position.

For HI-TEK microprocessor models, turn the key switch to the RUN position, choose a program and press the START button.

For SELECTA 28 models, select a wash program and press the Start button.

THE MACHINE(S) SHOULD NOT START !

- (b) CLOSE THE DOOR to start machine operation and, while it is operating, attempt to open the door without exerting extreme force on the door handle. The door should remain locked!

If the machine can start with the door open, or can continue to operate with the door unlocked, the door interlock is no longer operating properly. The machine must be placed out of order and the interlock immediately repaired or replaced. (See the door interlock section of the manual.)

3. DO NOT UNDER ANY CIRCUMSTANCES ATTEMPT TO BYPASS OR REWIRE ANY OF THE MACHINE SAFETY DEVICES AS THIS CAN RESULT IN SERIOUS ACCIDENTS.
4. **Be sure to keep the machine(s) in proper working order:** Follow **all** maintenance and safety procedures. Further information regarding machine safety, service and parts can be obtained from your dealer or from Wascomat through its Teletech Service Telephone - 516/371-0700.

All requests for assistance must include the model, serial number and electrical characteristics as they appear on the machine identification plate. Insert this information in the space provided on the previous page of this manual.

5. **WARNING:** DO NOT OPERATE MACHINE(S) WITH SAFETY DEVICES BYPASSED, REWIRED OR INOPERATIVE! DO NOT OPEN MACHINE DOOR UNTIL DRUM HAS STOPPED ROTATING!

SAFETY AND WARNINGS SIGNS

Replace If Missing Or Illegible

One or more of these signs must be affixed on each machine as indicated, when not included as part of the front instruction panel.

LOCATED ON THE OPERATING INSTRUCTION SIGN OF THE MACHINE:

CAUTION

1. Do not open washer door until cycle is completed, operating light is off, and wash cylinder has stopped rotating.
2. Do not tamper with the door safety switch or door lock.
3. Do not attempt to open door or place hands into washer to remove or add clothes during operation. This can cause serious injury.

PRECAUCION

1. No abra la puerta de la máquina lavadora sino hasta que la máquina haya terminado su ciclo, la luz operativa esté apagada y el cilindro de lavado haya completamente terminado de girar.
2. No interfiera o manipule el switch o la cerradura de la puerta.
3. No trate de abrir la puerta o meta las manos dentro de la máquina para meter o sacar ropa mientras la máquina está en operación, pues puede resultar seriamente herido.

MACHINE SHOULD NOT BE USED BY CHILDREN

LAS MÁQUINAS NO DEBEN SER USADAS POR NIÑOS

LOCATED AT THE REAR OF THE MACHINE:

INSTALLATION AND MAINTENANCE WARNINGS

1. When installed on a floor of combustible material, the floor area below this machine must be covered by a metal sheet extending to the outer edges of the machine.
2. This washing machine **MUST** be securely bolted to an uncovered concrete floor according to the installation instructions to reduce the risk of fire and to prevent serious injury, or damage to the machine.
3. This machine **MUST** be serviced and operated in compliance with manufacturer's instructions. **CHECK DOOR LOCKS EVERY DAY FOR PROPER OPERATION TO PREVENT INJURY OR DAMAGE.**
4. Disconnect power prior to servicing of machine.
5. This washing machine **MUST** be connected to a dedicated electrical circuit to which no other lighting unit or general purpose receptacle is connected.
6. **TO REMOVE TOP PANEL FOR SERVICE**, remove two screws under soap supply box cover, holding panel to the supply box, before unlocking. Be certain to reinstall screws when remounting the top panel to prevent leaks from the supply box.

MANUFACTURED BY ELECTROLUX-WASCATOR, LJUNGBY, SWEDEN
DISTRIBUTED BY WASCOMAT OF AMERICA, INWOOD, NEW YORK, USA
SOLD AND SERVICED BY INDEPENDENT WASCOMAT DEALERS

471 7446-00

LOCATED ON THE DOOR:

If you need to order more safety or warning signs, call Wascomat's parts department at 516-371-2000, or call your local dealer.

WARNING !

DO NOT ATTEMPT TO OPEN DOOR
UNTIL PROGRAM HAS FINISHED AND
DRUM HAS STOPPED ROTATING.

The manufacturer reserves the right to make changes to design and material specifications.

Safety instructions

- This machine is designed for water washing only.
- This machine must not be used by children.
- All installation operations are to be carried out by qualified personnel. Licensed personnel are necessary for all electric power wiring.
- The interlock of the door must be checked daily for proper operation and must not be bypassed.
- All seepage in the system, due to faulty gaskets etc., must be repaired immediately.
- All service personnel must be fully familiar with the operating manual before attempting any repair or maintenance of the machine.
- This machine must not be sprayed with water, otherwise short circuiting may occur.
- Fabric softeners with volatile or inflammable fluids are not to be used in the machine.

Introduction

Fig. 1 The Selecta 28 EX 7 and EX 10 models washer/extractor with high spin speeds, have been developed to cover the requirements of apartment house laundry rooms, insitutions, hospitals etc., where high quality automatic washing and quick formula variation are required.

The machines are free-standing, i.e. the drum is free to move relative to the frame of the machine, being suspended from it by springs. This results in a considerable reduction in vibration transferred to the frame of the machine, which in turn simplifies installation: no special foundation is required.

The machines offer 28 pre-set wash programs designed to suit a variety of fabrics. The machine is designed for connection to hot and cold water supplies.

All parts of the machine which come into contact with the items being washed are made of heavy gauge surgical stainless steel, ensuring long life and lasting beauty, as well as full protection for no-iron fabrics. The wash/extract motor, electrical components and water valves are made accessible for servicing by simply removing the top panel.

This manual contains a technical description of the Selecta 28 EX7 and EX10 model machines with instructions for their installation, operation and maintenance. Together with the wiring diagram which accompanies each individual machine it should be kept in a safe place for easy reference.

When ordering spare parts always give the machine serial number, model, voltage and other electrical characteristics appearing on the nameplate at the rear of the machine.

Installation

The machines are free-standing, i.e. the drum can move relative to the frame of the machine. This results in a considerable reduction in vibration transferred to the frame which in turn simplifies installation: no special foundation is required.

The machine is delivered complete with expansion bolts, template etc. packed inside the drum. Move the machine on its pallet to where it is to be installed before removing the pallet retaining bolts.

Location

Fig. 2 Install the machine close to a floor drain or open drain.

In order to make installation and servicing the machine easier the following clearances are recommended:

- At least 20" between the machine and the wall behind
- and a minimum of 2" on both sides of the machine whether installed next to the wall or other machines.

Where space is limited it is possible to reduce this distance to a minimum of 1" at the rear and sides, since most service operations are carried out from the front or top of the machine.

Floor

The floor must be able to withstand the following loads:

	EX7	EX10
static	390 lbs	550 lbs
dynamic	170 lbs	220 lbs
frequency of dynamic force	17 kHz	17kHz

Mechanical installation

The machine is delivered with the drum locked in place by four transport bolts fitted between the frame and the drum. In order to remove these and install the machine, proceed as follows:

- Unpack the machine.
- Fig. 3 • Slacken off the screws in the lower edge of the front cover plate and remove the plate by pulling downward and outward to unhook it from the chassis.
- Fig. 4 • Unscrew the retaining screws on the rear plate and remove the plate. Remove the drainage connection by unscrewing the two screws. Lift the drainage connection upwards until comes loose from the rear plate.
- Fig. 5 • Mark and drill two holes (diameter = 5/16") about 4" deep in the positions shown.
- Remove the machine from the transport pallet. Fit the adjustable feet provided.
- Place the machine above the bolt holes you just drilled. Always lift the machine by the chassis, never by the door or door handle.
- Fig. 6 • Remove the four transport bolts securing the drum to the chassis.
- Check that the machine is level and steady. Adjust the level by using the four adjustable feet (check first that they are screwed in as far as possible). Lock the feet using the lock nuts when the machine is satisfactorily positioned.

NOTE!

It is of utmost importance that the machine be level, from side- to- side as well as front- to- rear. If the machine is not properly leveled, it may result in a false out-of-balance cutout.

- Insert the expansion bolts supplied in the holes drilled in the floor.

Fit the washers and nuts, and tighten well.

After the machine has been in use for a while check and retighten the nuts if necessary.

Water supply

NOTE

All plumbing must conform to national and local plumbing codes.

Fig. 7 The water supply to the machine should be fitted with manual shut-off valves to facilitate installation and servicing.

Fig. 8 Water inlets are labelled for hot and cold water connections. Hoses should be flushed through before being connected to the machine.

Fig. 9 Connection hoses should be 3/4" reinforced rubber hosing not to exceed 6 ft in length. Make sure the hoses have no sharp bends or angles.

Water pressure should be:

maximum: 142 psi (10 kp/cm²)

recommended: 25-85 psi (2-6 kp/cm²)

Drain connection

Fig. Connect a 50 mm (2") flexible hose to the machine's drain outlet. Avoid sharp bends which may prevent proper draining.

10

The drainage pipe should be located over a floor drain, drainage channel or similar so that the distance between the outlet and the drain is at least 25 mm (1"). Refer to local regulations on water supply and drainage.

Electrical installation

IMPORTANT!

Electrical installation must be carried out by an authorized electrician, and must follow national and local regulations.

Make sure that the ground wire is correctly connected.

Fig. Each machine must be connected through its own circuit breaker.

11

The cable must hang in a gentle arc.

Depending on the electrical supply type available, the machine is to be connected as follows:

Fig. Machines connected for 3N AC.

12

Fig. Machines connected for 3 AC

13

Fig. Machines connected for 1 AC

14

Start-up and safety checklist

Before initial start-up of a Wascomat washer-extractor, the following safety checks must be performed:

Fig.
15

- Make sure that all electrical and plumbing connections have been made in accordance with applicable local codes.
- Use only flexible water fill and drain hoses of the proper length to avoid sags and kinks.
- Make sure the machine is properly grounded electrically.

Before the machine is operated, the door safety interlock must be checked for proper operation as follows:

Fig.
16

- When washer loading door is open, the machine must not start. Verify this by attempting to start washer with door open.

Fig.
17

- When washer is in operation, the loading door is locked and cannot be opened. Verify this by attempting to open the loading door when the machine is operating. If necessary, consult this manual for proper operation of the door lock and door safety interlock or call a qualified serviceman.

IMPORTANT:

Door safety interlock must be checked daily in accordance with above procedure.

WARNING:

Before servicing Wascomat equipment, disconnect electrical power.

Function control check-out list

In the machine cylinder, you will find the warranty registration card, a copy of the warranty policy and other pertinent material.

The warranty card should be completed and sent to Wascomat. All other items should be placed in a safe place for future reference.

The machine should be cleaned when the installation is completed, and checked out as detailed below without loading the machine with fabrics:

1. Check the incoming power for proper voltage, phase and cycles.
2. Open manual shut-off valves to the machine.
3. Turn on electric power.
4. Check the door safety interlock as detailed on page 9 of this manual.
5. Run through a complete cycle, checking for water temperature, drain operation and the extract function. For operating instructions, see the section marked "Procedure".

Fig.

18

NOTE

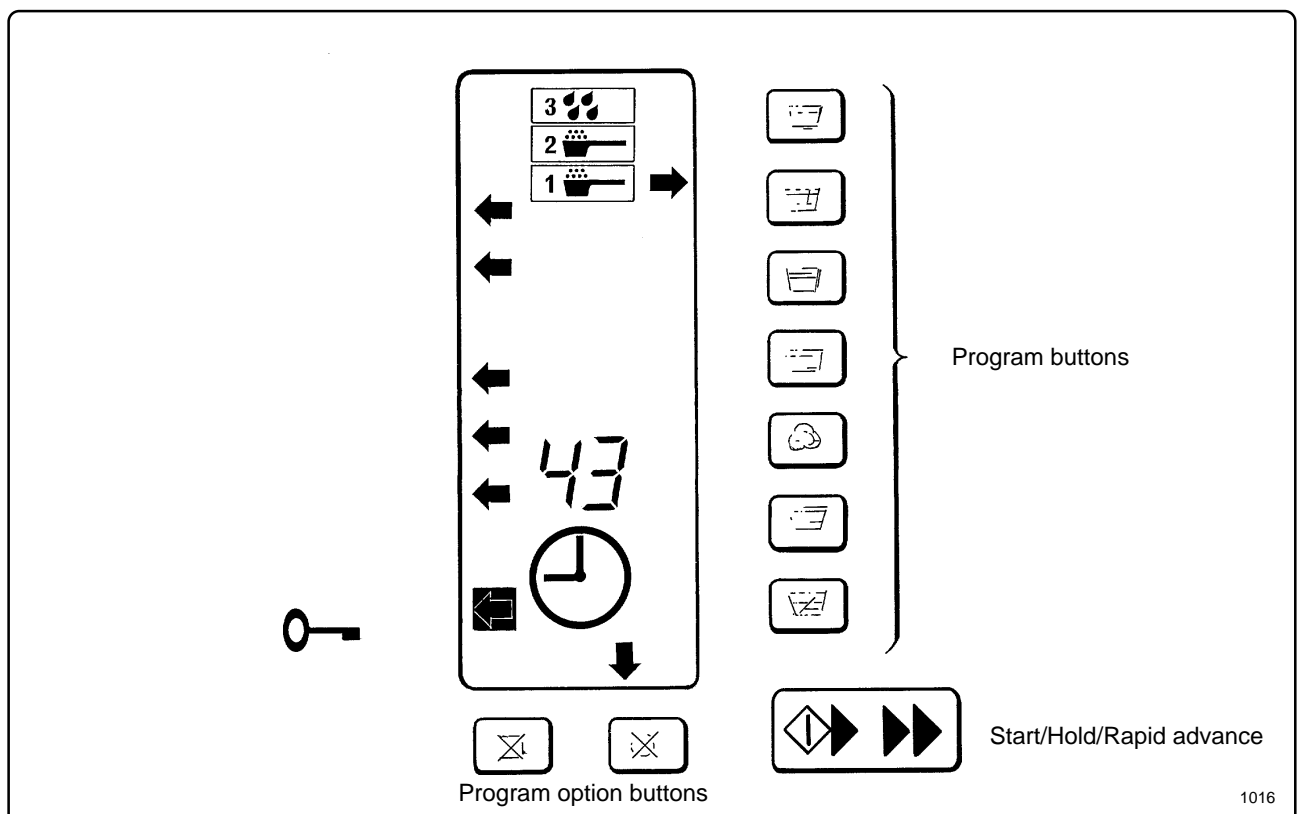

All machines are factory tested prior to shipment. Occasionally, some residual water may be found when the machine is installed.

Safety rules

- This machine is designed for water washing only.
- Machines must not be used by children.
- All installation operations are to be carried out by qualified personnel. Licensed personnel are necessary for all electric power wiring.
- The interlock of the door must be checked daily for proper operation and must not be bypassed.
- All seepage in the system, due to faulty gaskets etc., must be repaired immediately.
- All service personnel must be fully familiar with the operating manual before attempting any repair or maintenance of the machine.
- This machine must not be sprayed with water, otherwise short circuiting may occur.
- Fabric softeners with volatile or inflammable fluids are not to be used in this machine.

The control panel consists of seven program buttons, two programs option buttons and a combined start, pause and rapid advance button. A display panel with illuminated symbols shows the chosen program, the functions that have already occurred, those still to occur, and the remaining wash time.

If a fault occurs then indicators will refer the user to the fault list found under Service Information in this handbook.

Preparations

Sort the wash according to the choices shown on the control panel. Check washing tips on garment labels.

Make sure all pockets are empty and zippers are closed.

Open dum door, load articles and close door.

Washing

Fig.

19

- Set the program selector to the desired program.

An arrow to the right will light up to show selection. The five lowest arrows to the left will light up to show the stages that will be passed during the program.

Fig.

20

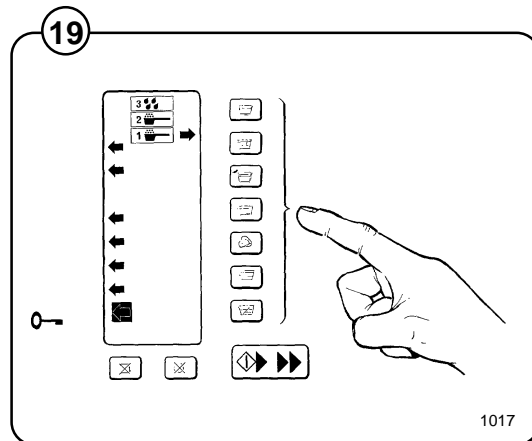

- Select other programs if desired by pushing program option buttons.

Arrows will show selected programs.

Fig.

21

- The five top arrows to the left will indicate which of the supply signals will be activated during operation. One window in the display will also indicate that detergent will be used during the wash program.

1017

1018

1019

Fig.
22

- Press **START**.

A clock dial will now appear in the display panel and two figures will show remaining wash time in minutes.

A colon will flash for five minutes. The machine can be restarted during this time with no loss of detergent. This allows you to rectify a possible mistake (eg: wrong program or wrongly sorted wash). (See **RESTARTING**)

Boxes around arrows will light up as each successive wash stage or supply signal is passed or used.

Fig.
23

After the machine has started you can check the wash temperature by pushing the program button. A thermometer will now light up showing the temperature in °C, both in a scale and as two numbers.

If the machine is not started and no buttons are pushed the program choice will disappear after five minutes and only the arrow next to the key symbol will remain lit (resting position).

Pause

Fig.
22

If for any reason a pause is desired during the wash then the **START** button should be briefly pressed. The machine will now stop, the arrow showing the current programstep will start to flash and the water outlet will remain closed.

The program may be restarted by a brief push on the **START** button.

Rapid Advance

Phases of the program can be bypassed by using Rapid advance.

- Fig. 24
- Hold the **START** button depressed until the indicators have gone past the unwanted stages.

Restarting

If you discover, within five minutes of starting, that a wrong program has been selected, or that, for example a wrong garment has been put in with the wash, then the machine can be restarted without the wash water emptying out.

A flashing colon in the display panel will indicate that restarting may proceed.

Change of program

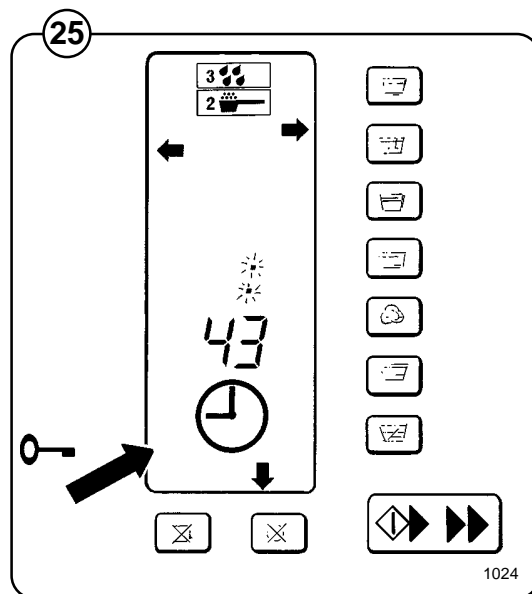

- Push **PAUSE**.
 - Choose a new program.
- Push **START**.

Restarting of same program

- Fig. 25
- Push **RAPID ADVANCE** through the whole program until the key symbol is reached. Wait until the box around the arrow lights up (about 30 secs.)
 - Open the door and remove the offending garment. Shut the door once more.
 - Push **START**.

WARNING

Remaining wash time will not be shown after Rapid Advance has been used.

Conclusion

Service Information

If there is a mains power failure the machines' memory will remember the selected program for about 8 - 10 minutes. The machines will restart automatically when power is restored.

Fig. 26 Program error is indicated by a number code in the display panel.

For codes 01 and 02 a new start may be attempted directly after the fault has been rectified. In the case of other codes the mains switch must be turned off and on again before the machines can be restarted.

If codes 03 - 09 appear, contact authorised personnel.

Fault Code	Cause of fault
01	Water level low. Open shut off valve. Try again.
02	Door lock defective. Open and shut. Try again.
03	Short circuit in or to the temperatur sensor
04	Too high temperature, check temperatur sensor and cable
05	Drainage defective.
06	Program defect.
07	Heating defective.
08	Drainage defective.
09	Out of balance switch defective

Built in service program

In order to facilitate function checks or possible fault finding, a service program has been built into the machine. This program should only be used by qualified service personnel.

Setting of service position

- Remove the machine's top cover.

Warning

Remember that the machine is under power when price programming is made.

Fig.

27

- Set the service switch to service mode. (The switch located on the circuit board behind the control panel display window).

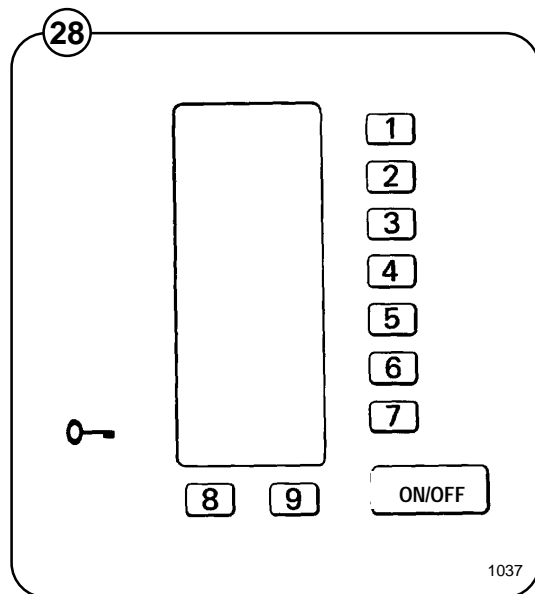

Fig.

28

This transforms the various program selection buttons into a numerical pad. Numbers 1-7 are on the program choice buttons, 8-9 on the supplementary program buttons and the START button serves as an ON/OFF switch.

CAUTION

When in service mode the number 0 does not exist. That's why only figures 11-19, 21-29 etc are used.

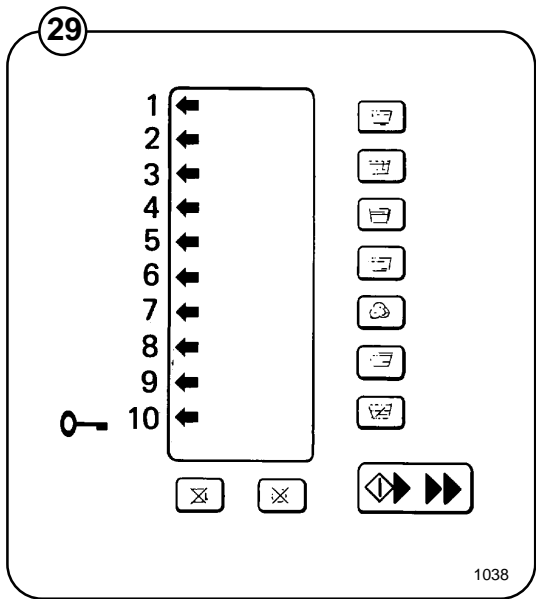

Function checks

Fig. 29 The program indicator on the display window indicates certain inputs by lighting arrows. For example, arrow number 5 is lit when the door closes. This shows that the door's micro switch is operating correctly.

The table below shows the inputs displayed by the program indicator.

Indicator	Function
1	-
2	-
3	-
4	Balance sensor switch
5	Door lock
6	-
7	-
8	-
9	-
10	ON/OFF (function entered using the various buttons - see below).

It is also possible to simulate certain functions by using the various program selection buttons on the control panel. The chosen function can then be turned on and off using the START button. Number 10 on the program indicator shows if the function is on or off.

The table on the next page shows which functions can be simulated, along with the number code for each.

Code	Function
11	Detergent supply 1
12	Detergent supply 2
13	Detergent supply 3
14	Detergent supplyt 4
15	Detergent supply 5
16	Connection valve, hot water
17	Connection valve, cold water
18	Connection valve, hard water
19	Heating (The temperature itself is shown in the display window, not the 19 code).
21	Motor, wash (clock-wise)
22	Motor, wash (counterclock-wise)
23	Distribution (counterclock-wise)
24	Extraction (counterclock-wise)
25	Clutch
26	Drain valve
27	Door lock.
28	Not used

CAUTION

The actual temperature reading is shown in the display window - NOT CODE 19.

Leaving service mode

- Fig. 30
- Flip the service switch on the circuit board back to OFF.
 - Replace the machine's top cover.
 - Select desired washing program.

General

The door, cycle indicator, and program-selection buttons are located at the front of the machine.

The motor and all control and indicating components, i.e. relays, level control, etc are assembled under the top cover, easily accessible from the top of the machine for simplified servicing.

Main units

- Fig. 31
- 1 Program selector - push-button switches for choice of different wash programs.
 - 2 Door - with automatic locking device which remains locked throughout the different wash processes.
 - 3 Detergent supply box - three compartments for automatic injection of powdered detergents and fabric softener.
 - 4 Inner cylinder - of stainless steel supported at the rear by two ballraces.
 - 5 Outer drum - of stainless steel (18/8) supported by a four spring suspension system. There are also four shock-absorbers to control the movement of the drum.
 - 6 Motor with an epicyclic gearbox - for reversing wash action, distribution and high speed spin action.
 - 7 Hot and cold water valves - program and level controlled solenoid valves for filling with water, and for flushdown of automatic detergent dispenser.
 - 8 Drain valve - timer controlled for draining the machine of water.
 - 9 Siphon breaker - to prevent water in the machine from re-entering the water supply system.
 - 10 Control unit - of plug in type.

Machine construction

Panels

The machines are equipped with a top panel made of stainless steel. The front panel is available in different colors or in stainless steel. The colored panels are made of phosphatized steel plate. For servicing purposes, the panels can easily be removed.

Frame

Fig. 32 The frame consist of a bottom plate and two balance weights. The balance weights form a cradle for the outer drum and are supported by four springs. There are four shock absorbers to control the movements of the drum.

Inner cylinder

The inner cylinder is made of perforated surgical stainless steel. It is equipped with three lifting ribs and has highly-polished side sheets and back with maximum embossed perforated area to assure high flow of water and supplies through fabrics.

Scientifically correct ratio of cylinder diameter and depth assures maximum washing action.

The shaft is electrically welded to the reinforced back of the cylinder. A specially designed chrome-plated sleeve bushing protects the seals from wear.

Back gable and bearing

Fig. 33 The back gable and the bearing trunnion housing are constructed of a webbed heavy casting for extra rigidity. There are three neoprene seals to protect from filtration of water. The sleeve bearings are water protected. An intermediate safety outlet provides an escapement for any possible condensation.

The seals are mounted on a chrome-plated, non-corrosive, specially hardened sleeve bushing that is mounted on the drive shaft to prevent wear of the seals and shaft. The main bearing is fitted machine-tight into the bearing trunnion housing. A C-clamp is placed on the shaft to prevent the cylinder from moving in and out.

The extension of the bearing trunnion housing supports the rear bearing holding the shaft. The bearings are permanently lubricated and need no maintenance.

Description

The door locking mechanism is a safety system that prevents injury by:

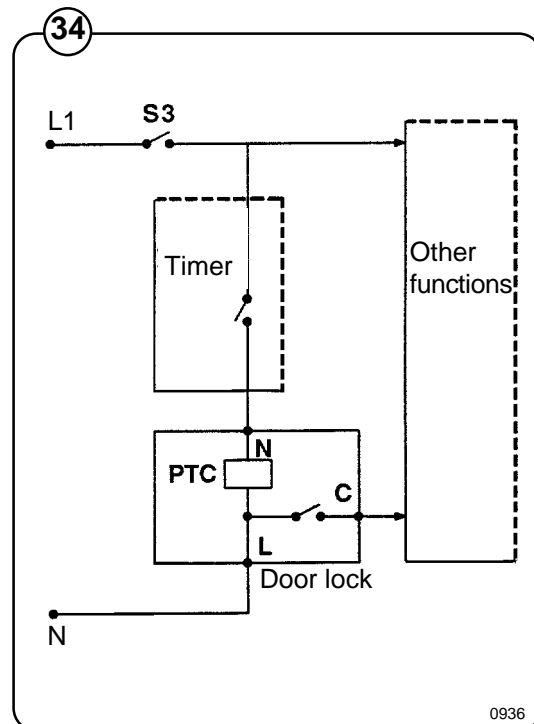

- Preventing the machine from starting before the door has been closed and the handle secured.
- Locking the door automatically when the machine starts.
- Preventing the door from being opened before the program has been concluded and the drum is stationary. This ensures that the drum is stationary when the door is opened and that there is no water in the machine.

Brief description of the locking action

- Fig. 34**
1. Door is closed Microswitch S3 is operated by the door and closes.
 2. START button pressed The program Timer energises the PTC resistor in the locking mechanism. This causes the bimetal strip in the mechanism to heat up and toggle over to lock the catch. It also operates an electrical contact, connecting the N line to the connectors and valves in the machine.
 3. Program runs
 4. Program is finished The supply to the PTC resistor is disconnected, allowing the bimetal to cool. When it has cooled, it toggles back and releases the catch, while the electrical contact interrupts the common (N) connection to the connectors and valves.

NOTE

Do not repair a faulty door lock. Always replace the old unit with a new one, to assure proper operation of the door safety interlock.

Replacement of door lock

- Fig. 35**
1. Remove the retaining screws securing the front panel and slide the panel downwards until it disengages. Lift it away.
 2. Open the door of the machine.
 3. Remove the door lock by undoing the two retaining screws and remove the locking plate (1).
 4. Pull the lock outwards at the side of the front trim (2).
 5. Transfer the electrical connections from the old locking mechanism to the new locking mechanism, one at a time.
 6. Position the new locking mechanism behind the front trim (3). Position the striker plate and secure it using the two retaining screws (4).
 7. Close the door of the machine and check that the door lock is working.
 8. Engage the front panel, and slide it upwards until it can be retained by the two screws in the bottom. Fit the two screws (5).
 9. Check that the door switch is operating properly by starting the machine and checking that the door cannot be opened while the program is running.

Control unit

Fig. The timer and program selector are mounted just behind the control panel.

36

Relays and level controls are located at the top of the machine, easily accessible for service.

Electrical connections to the machine are made by quick-disconnect plugs.

The correct circuit diagram is sent with each machine.

Relays

Fig. The Selecta 28 EX7 and EX10 models employ four relays. The relays control:

37

- wash speed forward
- wash speed reverse
- distribution speed
- extraction speed

Construction

Fig. The body of the relay holding the stationary contacts is made of current-resistant plastic. A solenoid and a contact bank hold the moving contacts. The contacts are spring-loaded to assure the correct contact pressure.

38

The relay is constructed for continuous operation, whether mounted horizontally or vertically.

Screw-type terminals provide perfect connections even when one or two wires have different diameters.

Operation

When the solenoid is energized, the two halves of the magnet core are drawn together, pulling down the moving contacts, thus making or breaking the circuit. When the current cuts out, springs force the contact bank into its original position, thus closing or opening the circuits.

Trouble shooting

If the relay fails to operate despite power to the coil, turn off the power and check the solenoid by measuring the resistance across the terminals (1).

If the relay hums when power is applied, this indicates either a break in the insulator holding the moving contacts at the axle where it holds the top half of core (3) or a rusty core (4), which can be cleaned.

Make sure that the moving contact assembly moves freely. Always replace burnt or pitted contacts (2) ... do not reuse contacts.

Drive motor

Description

Fig. 39 The motor is mounted on top of the outer drum, on stepped feet to provide a means of adjusting the belt tension. The motor drives the drum through a gearbox and centrifugal clutch via a V-belt.

The motor consists of stator, rotor and end-shields with ball-bearings. The stator and the rotor consists of plates, insulated from each other and welded together. The stator is provided with slots in which three windings are wound (one 6-pole for washing action, one 4-pole for distribution speed and one 2-pole for extraction). The windings are impregnated with a temperature-resistant sound-insulating resin varnish according to class B. The end-shields are die-cast. The ball bearings are permanently lubricated.

The gearbox and centrifugal clutch are mounted in one housing on the motor shaft, with the outer casing serving as the belt drive pulley. At washing action speed, the clutch is disengaged, with the result that the motor drives the pulley through a gear reduction. At spin speed, the centrifugal clutch engages and gradually locks the planet carrier to the pulley casing. The pulley is thus accelerated up, by conventional clutch action, to full spin speed, at which speed it is rotating at the same speed as the motor shaft. This arrangement provides a change from washing action speed to spin speed, that requires only one drive motor.

Stepped motor mounts on the outer drum provide a means of adjusting the belt tension. Four bolts secure the motor to the outer drum. Wedge-shaped mounts with a number of steps between the motor feet and the mounting points allow the motor position to be adjusted to give the required belt tension.

The motor incorporates a thermal overload protector, embedded in the motor windings. If the temperature of the windings exceeds about 150° C, the contact interrupts the circuit to the motor contactors.

Tensioning the drive belt

1. Slacken the motor securing bolts.
2. Adjust the position of the step wedges until the correct belt tension is obtained. Always adjust the wedges in pairs so that the motor shaft remains parallel to the drum shaft.
3. Retighten the nuts securing the motor.

Replacement of clutch shoes.

Fig.

40

1. Slacken the nuts securing the motor and pull the step wedges outwards to slacken the drive belt. Remove the belt.
2. Disconnect the motor cable connector and remove the motor.
3. Using a puller, pull off the clutch shoe carrier from the motor shaft.
4. Gently tap the replacement clutch shoe carrier onto the motor shaft.
5. Reposition the motor and replace the nuts loosely. Fit the drive belt and connect the motor plug.
6. Tension the drive belt as described above under Tensioning the Drive Belt.

Replacing the gears

1. Slacken the nuts securing the motor and pull the step wedges outwards to slacken the drive belt. Remove the belt.
2. Disconnect the motor cable connector and remove the motor.
3. Using a puller, pull off the clutch shoe carrier from the motor shaft.
4. Remove the circlip from the motor shaft and remove the four screws that secure the gearbox to the motor casing.
5. Using an extractor, pull the gearbox off the motor shaft.
6. Pass a new gearbox over the motor shaft and secure it to the motor frame by means of the four retaining screws.
7. Refit the circlip to the motor shaft and gently tap a replacement clutch shoe carrier onto the motor shaft.
8. Reposition the motor and replace the nuts loosely. Fit the drive belt and connect the motor plug.
9. Tension the drive belt as described above under Tensioning the Drive Belt.

Checking the motor windings

Fig. 41 At room temperature, the motor windings should have the approximate resistances as shown below, when measured between the appropriate connectors in the plug:

Machine model	Resistance (ohms) between terminals:							
	1-4	2-4	3-4	5-7	6-7	8-9	8-10	9-10
Ex 7	2.6	1.6	3.5	2.6	1.6	4.7	4.7	4.7
EX 10 120V	1.3	0.8	1.7	1.3	0.8	3.4	3.4	3.4
Ex 10 208-240V	4.0	2.7	7.7	4.0	2.7	11.4	11.4	11.4

As a further check, the No-load current with V-belt removed is as follows:

Machine model	No-load current (amps) at terminals:								
	Wash			Dist.					
	8	9	10	2	7	1	3	4	7
Ex 7	3.6	3.6	1.9	6.2	6.2	6.6	5.6	6.6	3.9
EX 10 120V	4.7	5.5	2.4	8.9	8.9	11.0	6.4	11.0	6.8
Ex 10 208-240V	3.0	2.6	1.45	5.4	5.4	6.8	3.6	6.8	4.5

Water level controls

Fig. 42 One pressure switch (1) is used to control the correct water levels during various cycles of the washing program.

Adjustment

All pressure switches are factory-calibrated to meet specific requirements. The trip level for any one pressure switch can be changed only within narrow limits because each trip range requires a different set of springs.

Water level

Fig. 43 As a guide for checking the level control for proper functioning, the low level should be when the water just reach to the top of the paddle (1), and the high level when the water just reach the outer edge of the tapered section in the rear of the of the drum (2).

Inlet valves

Construction

Fig. 44 The valve has a single-inlet with either one, two or three outlets, each with its own solenoid coil. The body is made of heat-resistant polyamid plastic and the solenoids encased in water-tight plastic.

A filter screen on the inlet side prevents dirt from entering the valve. Flow restrictors can be placed at either the inlet or any of the outlets.

Operation

Fig. 45 When the solenoid is energized, the spring-loaded plunger is drawn up and the pilot valve in the center of the diaphragm opens. Because of the difference in diameter between the pilot valve opening and the ventilating hole in the diaphragm, the pressure above the diaphragm drops to a point where the admission pressure below the diaphragm can lift the diaphragm, thus opening the valve.

When the current to the solenoid is cut off, the plunger spring will press the plunger against the pilot opening of the diaphragm. The pressure above the diaphragm then rises to correspond to the water inlet pressure and the pressure of the spring will close the valve.

Repair instructions

Limescale can block the holes in the valve diaphragm and interfere with the function of the valve.

Fig. 46 It is therefore advisable to dismantle and clean the valve at certain regular intervals. The frequency depends on operating conditions and the level of contamination in the water.

If the valve does not open

- Check that power is supplied to the coil.
- Check the coil with an instrument to determine whether there is a break or a short circuit.
- Dismantle the valve (see below) and check the openings in the valve diaphragm.
- Check the inlet strainer and clean as required.
- Undo the coil and clean the surfaces of the magnetic core.

If the valve does not close

- Check that the coil is not live. The valve is normally closed when the magnet is not energised.
- Check the return spring.
- Check the diaphragm (pilot pressure opening).

Dismantling the valve

Fig. 47 • Pull the coil straight upwards. Use a screwdriver if necessary to carefully undo the coil.

Fig. 48 • Use the tool supplied (attached to one of the hoses when the machine is delivered) to open the valve housing. Slide the tool over the protruding plastic sleeve to that the pegs on the tool engage the corresponding sockets in the valve housing.

- Use a spanner or a pair of pliers and unscrew the upper part of the valve housing.

Soap supply box

Fig. 49 The three-compartment soap supply box is located at the top of the machine. Viewed from the front, the compartments marked with figures 1, 2 and 3 are used as follows:

Compartment 1

This compartment is used for adding detergent to the wash at the start of the Soak cycle.

Compartment 2

This compartment is used for adding supplies to the wash at the beginning of the Wash cycle.

Compartment 3

The small compartment is used for adding fabric softener, which is flushed down by a siphon action at the start of the third rinse.

Drain valve

Description

Fig. The drain valve is a motor-operated membrane valve having a large opening cross-section to produce rapid emptying of the machine. The rapid flow action produces a self-cleaning effect, eliminating the necessity for a fluff filter.

50

The main parts of the valve are:

- Motor and gear
- Trapezoidal-threaded piston rod with piston and return spring
- Rubber membrane
- Connections for water filling, overflow, drain and level switch

When de-energised, the valve is open. In this state, the piston, under the action of the return spring, is at the bottom of its travel. The membrane follows the piston downwards and the valve is open.

Energizing the motor drives the piston upwards through the action of the gear and the trapezoidal thread, pressing the membrane against the valve seat and closing the valve.

The overflow connection is connected to the siphon breaker, so that water and foam are discharged directly to drain if the inlet valve or level switch should fail.

Repair instructions

Lime deposits or dirt on the membrane can result in the valve not opening or closing correctly. The valve should therefore be cleaned at regular intervals, depending on operating conditions and water quality.

Valve does not open or close correctly

- Check that the motor is correctly energised
- Check that the piston rod can move freely
- Check that the membrane is not clogged with deposits

When changing the motor and gear assembly, note the following cable connections:

Brown cable: 60 Hz

Blue cable: Common

Black cable: 50 Hz

Pre-tensioning the return spring

Fig. Remove the valve casing.

51

1. Turn the return spring so that the arm of the spring bears against the stop screw.
2. Fit the piston rod so that the slot in which the spring is to engage is aligned with the casing. Place the valve casing over the return spring so that the pin on the spring fits into the slot in the piston rod.
3. Turn the casing through one turn clockwise. This will engage the pin on the spring in the piston rod, tensioning the spring by about 1/4 of a turn due to the rise of the piston rod.

51

Maintenance

Preventive maintenance has been reduced to a minimum by the careful design of reliable components and material.

However, the following measures should be taken at regular intervals and in proportion to the hours of service.

Daily

- Check the door lock and interlock before starting operations.
- Start the machine and check that the door remains locked while the machine is operating. Use the Rapid Advance function to step the program to the Stop position and check that the door stays locked until 30 seconds after the program is completed.
- Clean the door seal and remove powder residue. Check that the door does not leak.
- Clean the detergent compartments and wipe down the machine with a damp cloth.

Fig.

52

- Check that the drain valve does not leak, and that it opens properly.

Weekly

- Remove lint or fluff remnants from the drain opening, joints in drain pipes, etc.

Every third month

- Check for leaks in valves, hoses and connections.
- Check that the V-belts between the motor and pulley is undamaged and correctly tensioned.

IMPORTANT!

Make certain that all electrical power to the machine is shut off before removing top or rear panels.

Trouble shooting

If machine does not start

Check to ensure that:

- it is turned on at the mains.
- the manual shut-off valves are open.
- a program has been selected.
- the drum door is locked
- the glass cartridge fuse is not blown.

If water does not drain

- Fig. 53
- A** Check drain valve for proper operation.
- B** Disconnect drain hose connected to drain line. If full flow of water comes out, the problem is in the main waste line. If water flow is slow, the problem is the accumulation of foreign materials between the drain valve and shell outlet of machine. Clean valve body of any foreign objects found.

If machine does not extract

- Fig. 54
- A** Check extract relay and relay coil for proper operation.
- B** Check level control tube for clogging

If motor does not operate at wash speed

- Fig. 55
- A** Check wash relays.
- B** Check motor and V-belt.
- C** Check normally-closed contact of extract relay.
- D** Review procedures outlined under section "If machine does not start" above.

If machine runs slowly on wash speed or there is a slapping or thumping noise.

Fig.

56 A Replace V-belts

If a metallic noise can be heard at rear of machine

Fig.

57 A Tighten pulley on motor shaft

57

If there is a leaking around the glass

Fig.

- 58** **A** Replace door gasket if worn.

If water does not enter the machine.

Fig.

- 59** **A** Be sure manual shut-off valves are in open position.
 B Check the coils on inlet valves.
 C Check wires leading to value coils.

If water continues to fill without stopping.

- Fig. **A** Check hose attached to level control unit.
- 60 **B** Check inlet valves for dirt underneath the valve diaphragm. To localize, shut off power. If water continues to flow, inlet valves have foreign material in them and should be thoroughly cleaned.

If water continues to flow without filling machine.
